## INTRODUCTION

# The Lifestyle Shift

This plan is not a "flash in the pan" diet where you lose weight only to put it straight back on.

We have all seen those "miracle" programs that promise the world, only to leave you hungrier and heavier than when you started. This is different. This is a way of life—a lifestyle. It is a way of eating that you will continue forever because it actually feels good. I do it every day, and so do all my clients. The best part? We do it all while eating incredibly satisfying food!

With this plan, you will not only lose weight, you will shed stubborn body fat, lower your BMI (Body Mass Index), and significantly reduce your chances of contracting Type 2 Diabetes, Cancer, Heart Disease, and Alzheimer's. All the while, you are not sacrificing your health for a number on a scale. You will be maintaining your muscle, increasing your water percentage, and boosting your mental acuity, energy levels, and your immune system.

### **The Search for a Better Way**

Best-U started because of a personal crisis. Like many people, I put on a lot of weight during Lock-down. I found myself in a body I didn't

recognize. Now, I have competed in high-level sport for over thirty years and have tried nearly every single diet I've ever heard of. I've done the high-protein grinds, the low-fat struggles, and everything in between. There were positives and negatives to each, but none of them ticked all of my boxes.

I knew what I wanted: a plan that could fit into a modern, busy lifestyle. It had to be achievable "on the run" for people with real jobs and families. It had to provide sustained energy rather than mid-afternoon crashes. Most importantly, it had to be a plan where I didn't have to go to bed hungry. I simply cannot go to bed with a growling stomach; to me, that is the ultimate sign of a failing plan. Yet, it seemed that every diet on the market demanded that sacrifice.

I decided to stop looking for the answer and start building it. I researched and combined the current sciences of a super high-calorie keto diet, intermittent fasting, portion control, nutritional timing, and even the "French diet" philosophy of quality over quantity. I took the best parts of each and experimented on myself with this new formula. The results were staggering: I easily lost 17kg in just 8 weeks, and I felt more alive than I had in years.

## **The Proof in the Results**

This is when I met Client #1. After telling him what I had done and the results I had achieved, we decided to see if the formula worked for others. Since he was 140kg and clinically Pre-Diabetic, I took his health very seriously. I insisted that before we started, he get full medical reports, followed by regular blood tests to make sure the plan was doing no harm.

The results represented a total overhaul of his health and vitality. When we received the final doctor's report, not only had he reduced his weight by 20kg, but his internal health had been completely overhauled. We didn't just lower his fat and BMI; his water percentage and energy levels sky-rocketed. His cholesterol was the lowest it had ever been

in his adult life, and his diabetic markers had returned to a normal, healthy level. He didn't just lose weight—he gained a completely new lease on life. He is a new man.

## **A Plan for Everyone**

This plan is for everyone, regardless of where you are starting from. It works by changing your internal fuel source to minimize the "Postprandial dip"—that heavy, lethargic "food coma" most people feel after lunch. By stabilizing your system, we give you massive amounts of increased energy while you continue to eat very satisfying, rich food.

In my experience, this is the only plan that successfully tackles the greatest challenge in weight loss: "Hunger Satisfaction." Almost any plan can work for a week or two if you have iron willpower, but none that I tried actually satisfied me. I always knew that as soon as I stopped the "diet," I would go back to exactly where I was because those plans weren't realistic for real life. Best-U is different.

## **Why It's Sustainable**

I'm going to teach you exactly what food is on the plan and, more importantly, the best times to eat these satisfying foods to maximize your metabolism. I'll teach you what to buy when you're in a rush at a convenience store and exactly what to order when you're sitting at a restaurant with friends. This plan doesn't ask you to hide away from the world; it fits in with your lifestyle, at any time.

You can even keep your social life! You can drink on this plan, depending on your specific goals. If you choose to have zero alcohol, you can lose up to 5.8kg per week. However, I have many clients who still enjoy a drink 3-4 times a week and are still losing a consistent 1kg per week while feeling a massive increase in energy. It is a lifestyle, not a race.

## **The Journey to Your Best Self**

I created the Best-U nutrition plan to be the final word in weight management. In the last two years alone, I have helped over 150

people lose an average of 10.3kg. This is not a "struggle" where you white-knuckle your way through a few weeks only to yo-yo back later. This is a plan you will continue for the rest of your life because you will feel too good to ever go back.

My clients frequently tell me they could never imagine eating any other way. Why would you? You get to lose weight and fat, improve your BMI, and drastically reduce your risk of major diseases while improving your immune system and mental clarity. You get to do all of this while eating delicious, real food.

I am 52 years old, and since I created the Best-U plan, I am in the best shape of my life. I am thinking faster and clearer than I was when I was playing top-level sport thirty years ago. I know exactly how hard it is to lose unwanted weight because I lived it. I was the fattest kid in my high school. When I was thirteen years old, I weighed 105kg and was much shorter than I am now. For comparison, I am 88kg today. I have been struggling with food, hunger, and weight loss nearly my whole life. I decided to dedicate my life to finding the best way to fuel the human machine.

**I found it. Now, let's find the Best-U.**

## CASE STUDY #1

# The World Champion's Perspective

*"As a six-time World Champion across five different weight categories, I have spent my entire career experimenting with eating plans. I've tried them all. The problem was that none of them truly worked for me in retirement; I was always left hungry and unsatisfied.*

*When I reached out for a plan that would actually fit my lifestyle, Aaron Caville from Best-U contacted me. He promised his approach was different—designed specifically to reduce hunger and be sustainable for the long haul. He was right.*

*On the Best-U plan, I lost 10kg and saw a massive increase in both my physical and mental energy. The best part? I didn't have to sacrifice my social life; I could still enjoy a drink while reaching my goals. It's been over a year now, and I've maintained my weight easily. This isn't a diet; it's an enjoyable lifestyle that I would recommend to anyone."*

## CHAPTER 1

# The Evolution of the Machine

## My Sporting History

"You don't put  
Diesel in a Ferrari"

To understand why I am so passionate about the Best-U blueprint, you have to understand where I came from. I didn't just read about nutrition in a textbook; I tested it on the field, in the ring, and on the court for over thirty-five years.

My journey started early. By the age of thirteen, I was already playing 1st Fifteen Rugby. By twenty-one, I was playing Senior-A Rugby as a 115kg Prop Forward. That role requires raw power and a massive engine, and it was my first real lesson in how weight affects performance. From there, my career took me to Japan, where I played for three years and eventually represented Japan in the Manila Tens Competition.

When I returned to New Zealand, I shifted my focus to the ring, competing in seven boxing matches. Most recently, I represented New Zealand in Basketball at the Masters Games, where we secured a Bronze Medal.

Throughout these four decades of competition, the gym has been my second home. I have trained every single week, constantly learning and experimenting with new techniques. When you compete at this level, your social circle consists of elite athletes who view food through a single lens: Fuel. We are constantly discussing, debating, and trying

new diets in search of the "ultimate formula" for performance, sustained energy, and maximum physical gains.

After decades of trial and error at the highest levels of sport, I've finally found the missing piece. I've tried every 'elite' formula out there, but they always required a trade-off—usually sacrificing energy for weight loss or mental focus for physical bulk. Best-U is different. It is the first plan that provides the explosive strength needed for the gym and the sharp, focused agility required for high-stakes performance.

For the first time, I'm not just fuelling for a game; I'm fuelling for life.

## Fuelling for the Long Game: Healthy Aging

As I moved into my 50s, my goals began to shift. It was no longer just about how much I could lift or how fast I could move in a single match; it was about longevity. Most people accept "slowing down" as an inevitable part of aging. They expect the brain fog, the stiff joints, the creeping weight gain, and the loss of muscle mass.

I am here to tell you that those are not requirements of getting older—they are symptoms of improper fuelling. Best-U is specifically designed to support Healthy Aging by tackling the four pillars of longevity:

**Strength & Muscle Preservation:** The most common sign of aging is losing strength. Best-U focuses on maintaining and building lean muscle mass. This isn't just about looking good; muscle is your body's largest metabolic organ. Increased strength protects your joints, improves your balance, and keeps your metabolism burning hot, even as the decades pass.

**Metabolic Health:** By stabilizing blood sugar and reducing the risk of Type 2 Diabetes, we protect the heart and the brain from the "wear and tear" that usually comes with age.

**Cognitive Preservation:** The high-quality fuel sources in this plan are neuro-protective. They help clear the "brain fog" and provide the

mental clarity needed to stave off the cognitive decline often associated with Alzheimer's and dementia.

**Cellular Repair:** By reducing systemic inflammation, we allow the body to heal and maintain its immune system, keeping you "young" at a cellular level.

I am 52 years old, and I can honestly say I am in the best shape of my life. I have more energy, more functional strength, and think faster today than I did as a top level athlete thirty years ago. Aging shouldn't mean a decline in quality of life; it should be the period where you finally have the wisdom and the health to enjoy everything you've worked for. Best-U gives you the blueprint to do exactly that.

## CHAPTER 2

# The Testing Ground

## Lock-down Weight and Which Diet

Nothing tastes as good  
as healthy feels.

### **The Turning Point: Finding the Formula**

During the lock-down, like so many others, I lost my way with my nutrition. I watched the scales climb until I hit 99kg—nearly 20kg over my healthy baseline of 82kg. I knew I had to get back in shape, but I faced the same exhausting question we all do: Which diet should I choose?

I looked at the landscape of "proven" methods. Should I track Macros? Try Intermittent Fasting? Go Paleo or Atkins? What about Isagenix, Body for Life, Weight Watchers, or Jenny Craig?

Here is the truth: they all "work" in a laboratory setting. But for me, they all failed in the real world. Some left me feeling utterly exhausted; others were so mathematically complex that you had to measure every leaf of spinach before you could eat it. Some were just plain boring. But the biggest deal-breaker? They were impossible to maintain on the run.

The final straw for me was the hunger. Almost every plan on the market demanded that I go to sleep with a growling stomach. I once asked a guy with the most ripped physique I'd ever seen how he stayed so lean. He looked me in the eye and said, "I go to bed hungry every night."

I realized then and there that I couldn't live like that. Believe me, I've tried. If a plan requires me to suffer through hunger every night, it isn't a lifestyle—it's a sentence.

### The Experiment

Instead of following someone else's rules, I decided to build my own. I turned my body into a laboratory and began a period of intense self-experimentation. I would take one theory—say, a specific fasting window—and stick to it 100% for weeks. I meticulously recorded the data: my weight, body fat percentage, energy levels, and my "hunger score."

Then, I would layer in another theory. I experimented with portion sizes, timing between meals, and the impact of specific additives in my coffee. I tested what happened when I increased or decreased my fasting periods. If a new variable worked, it stayed in the formula. If it made me sluggish or hungry, it was cut.

I was searching for the "Goldilocks" zone: the exact point where I could lose the most fat and retain the most muscle, while maintaining peak energy and mental clarity.

### The Result: Best-U

After months of trial and error, I found it. I discovered a formula that didn't just drop the weight—it improved my skin, gave me the best sleep of my life, and sharpened my mind. Most importantly, I felt **amazing**, and I wasn't going to bed hungry.

I want to be clear: I didn't "invent" the science. The science of keto, fasting, and metabolic health is tried, tested, and proven. What I created was a new **formula** for applying that science in a way that actually works for a busy, modern life.

This is **Best-U** because "Best" equals minus "U." Also the U stands for University as it teaches you the Best way to eat.

## CHAPTER 3

# The Science of Why We Fail

## Why Diets Fail

There is a revealing documentary on Netflix titled Why Diets Fail, and it nails the primary reason for most people's struggles: Hunger.

You can force yourself to eat plain chicken, broccoli, and white rice for a few weeks to reach a goal, but let's be honest—it's boring. More importantly, it is not sustainable for life. You might be eating the "correct" food according to a textbook, but you are left feeling constantly empty.

I know exactly how hard it is to try and control the beast that is your hunger. It is that relentless voice in your head that screams, "Feed me!" from the moment you wake up until the moment you sleep.

This is where the Best-U plan is different. We focus on high-calorie, nutrient-dense foods that actually cause you to eat less. This food is delicious, and it finally satisfies the beast.

My clients are often in disbelief that they can eat such rich, flavourful food while watching the weight fall off. It goes against everything we have been taught, but the results speak for themselves.

## Volume Versus Calories

For decades, we've been told the same lie: "Watch your calories. Don't eat too many calories." This is fundamentally wrong. It isn't the calorie count that matters—it's the **volume** that counts.

A calorie is simply a measurement of energy. The Best-U plan focuses on providing food with the highest amount of energy in the smallest possible volume. This allows your stomach to remain comfortable while your body feels fueled.

Consider this example: **100 grams of butter contains approximately 717 calories.** To get those same 717 calories from lettuce, you would have to eat **4.8 kilograms** of it. Think about that for a second. Imagine the difference in how your stomach feels processing 100 grams of rich food versus nearly 5 kilograms of roughage. They both provide the same amount of energy, but the volume is vastly different. By choosing high-calorie, low-volume foods, you naturally eat less because you aren't stretching your stomach to capacity just to find energy.

## Satisfaction Versus Filling

If I put a massive bowl of potato chips or fries in front of you, most of us could "smash" it quite easily—and probably still want more afterward. Correct? But if that same bowl was filled with hard-boiled eggs, cheese, nuts, or salmon, you couldn't finish it. Why is that?

Most people would say the second bowl is more "filling." But in reality, the nuts or salmon take up much less physical space in your stomach than a mountain of chips. The difference isn't that the food is filling; it's that the food is **satisfying**.

This is a biological process called **satiety**.

When you eat "real" food, your body runs a checklist:

- Protein? **Check.** \* Energy? **Check.** \* Essential fatty acids? **Check.** \* Nutrients and vitamins? **Check.** Processed chips are "hollow" food. Your body says, "Thanks for the energy, but where is the protein? Where are the nutrients?" Because the checklist isn't complete, the hunger signal stays turned on. When you eat nutrient-dense foods like salmon or cheese, your body concludes it has everything it needs. It signals the brain and says, "We're good. You can stop eating now."

By eating for satisfaction rather than just "filling the tank," you finally gain control over your appetite.

## We are Conditioned

We have been conditioned to believe that the goal of a meal is to eat until we are "full." This is a fundamental misunderstanding of how the human body works.

When we eat "hollow" food—processed carbs and sugary snacks—we are subconsciously waiting for a feeling of satisfaction that never comes. Because the food lacks the nutrients our body is screaming for, we keep eating, hoping that a full stomach will eventually signal a quiet mind. But weirdly, even when our stomachs are distended and uncomfortable, we still feel hungry. Why? Because we are full, but we are not **Satisfied**.

We have been taught to use "fullness" as a proxy for "satisfaction," but they are not the same thing.

When you eat a small amount of the right, nutrient-dense food, your body runs its internal checklist: Protein? *Tick.* Energy? *Tick.* Essential fatty acids? *Tick.* Vitamins? *Tick.* Once those boxes are checked, the body signals you to stop.

Conversely, when you eat hollow food, your stomach expands to accommodate the volume, but the internal checklist remains empty. This creates a dangerous cycle: as you eat more hollow food, your

stomach stretches. As your stomach gets larger, the physical "voice" that tells you to eat gets louder. If your stomach is large, that voice screams, "Feed me!" at a deafening volume.

### Three Types of Food: Protein, Fat, and Sugar

Nutrition is often made to seem incredibly complicated with talk of "macros," "micros," and "phytonutrients." But in reality, there are only three primary types of food you need to worry about: **Protein, Fat, and Sugar.**

Understanding the role of each is the key to mastering your weight:

- **Protein** is for building and repairing muscle.
- **Fat** is a sustained, long-burning energy source.
- **Sugar** is a fast-burning energy source.

Here is the most important realization I ever had: **If it is not Protein or Fat, it is Sugar.** Once I worked this out, everything changed. We often hide behind complicated words like "carbohydrates" or "starch," but your body sees them for what they really are. Apples? They are sugar. Broccoli? Sugar. Bread, wheat, pasta, and potatoes? All sugar.

While there are "good" sugars (like the fibrous structures in vegetables and some fruits) and "bad" sugars (like refined wheat, pasta, and starchy carbohydrates), they all fall into that third category. When you stop viewing a potato as a "vegetable" and start viewing it as a "sugar," you gain the power to choose fuel that actually serves your goals rather than just inflating your waistline.

I know this cycle intimately because I lived it. I was huge, and I spent years fighting that voice. This plan works because it finally silences it. When you eat very rich, high-calorie, nutrient-dense food, your body reaches a state of satiety quickly. You eat less, which allows your stomach to naturally shrink over time. As the stomach gets smaller, the voice gets quieter, until eventually—like me—you don't hear that voice anymore.

### Diesel in a Ferrari

A good friend of mine—a beautiful soul named David Mu—once told me: **"You don't put diesel in a Ferrari."** That stayed with me. We have all been given our own personal Ferrari to drive through life: our body. It is a high-performance machine. But what happens if you put diesel into a supercar? It runs poorly, it splutters, it smokes, and eventually, it stalls. This is exactly what happens when we put the wrong fuel into our bodies. We feel tired, sluggish, and heavy because our "engine" wasn't built for that grade of fuel.

### The Cost of the "Food Coma"

Take a single piece of bread as an example. It's a man-made, processed food. It takes your stomach between two and four hours to process that one slice. During that window, your body has to divert a massive amount of energy to digestion. This is why you feel exhausted after lunch—a phenomenon known as the Postprandial Dip, or more commonly, the "Food Coma."

The end result of that struggle is roughly three teaspoons (15 grams) of sugar. The simple fact is that we are not designed to live on sugar. It is the most addictive substance on the planet—more so than cocaine or heroin—and we are consuming far more of it than we realize. Remember: if it isn't fat or protein, it's sugar.

### Efficiency: Sugar vs. Fat

When it comes to fuelling your machine, not all energy is created equal.

- **1 gram of Sugar** contains 4 calories.
- **1 gram of Fat** contains 9 calories.

If you switch your body's primary fuel source to fat, you are using a fuel that contains 225% more energy per gram than sugar. Not only is it more powerful, but it is also significantly faster to digest.

Let's look at the "Bread vs. Egg Yolk" comparison:

**The Bread:** Takes 2–4 hours to process. The result is 34 grams of weight for only 58 calories of energy.

**The Egg Yolk:** Takes mere minutes to process. It weighs only 16 grams but provides 52 calories of energy.

The egg yolk is less than half the weight of the bread, yet provides nearly the same amount of energy. Because it processes so quickly, you spend almost zero time in the "Food Coma." You get the energy boost without the spluttering and stalling.

Now, imagine the difference in volume between three eggs and three slices of bread. They might offer similar protein and energy, but the eggs weigh less, process faster, and take up far less space. This allows your stomach to naturally shrink while your energy levels sky-rocket

**That is the Best-U formula in action: High-grade fuel for a high-performance machine.**

## The Mice Study: Why We Can't Stop at One

To understand why we struggle to stop eating certain foods, we have to look at how our biology reacts to specific combinations of fuel. A landmark study, "The snacking rat as a model of human obesity," illustrated this perfectly using three groups of mice.

The first group was fed **standard "chow"** (balanced, natural food).

The second group was given a **fixed High-Fat, High-Sugar diet**.

The third group was given a **"Free Choice" High-Fat, High-Sugar diet**.

The results were staggering. The "Free Choice" group—those given unlimited access to both fat and sugar—consumed **40% more food** than the group eating standard chow.

The science is clear: as soon as you combine high fat with high sugar, your body's internal "off switch" breaks. You aren't just hungry; you are physiologically driven to crave 40% more than you actually need.

## The "Moreish" Trap

I know this to be true from my own life. I used to sit down with a large Butter Chicken, a huge portion of rice, and a side of naan bread. I would clear the plate and still feel like I could keep going. I was full, yet I was still hungry.

Today, I eat half that portion of Butter Chicken, but I skip the rice and the naan. The result? I am completely satisfied. However, I know that if I were to add just a single spoonful of rice back into that meal, the "40% Rule" would kick in. My brain would immediately demand more, and I'd be back in the trap.

Think about the foods we describe as "moreish"—chocolate, fries, burgers, doughnuts, and pizza. They all share one thing in common: they are an engineered combination of processed fat and high sugar. In the natural world, you almost never find these two elements occurring together in high concentrations in a single food source.

These combinations are meticulously designed. The food industry knows exactly what they are doing; they have essentially hacked our evolution. They "bank" on the fact that this specific fat-and-sugar pairing bypasses your body's satiety signals, ensuring you never feel truly satisfied. This keeps you addicted and guarantees you keep coming back for more.

If you are struggling with your weight, realize this: It is not your fault. You aren't weak; you are being targeted by an industry designed to make you overeat.

I still love a good burger—it's actually my favourite food. But now, I've learned how to enjoy it without the "trap." I eat the meat, the cheese, and the toppings, but I ditch the bun and the fries. By removing the sugar (the bun), I remove the craving. I walk away feeling satisfied,

energized, and—most importantly—in control. Once you get your head around this reasoning, it changes everything.

## Sugar is More Addictive Than Cocaine

To understand why it is so difficult to "just say no" to a dessert or a soda, we have to look at how our brains are wired. A ground breaking study titled "*Intense Sweetness Surpasses Cocaine Reward*" put this to the ultimate test.

In this experiment, mice were given a choice between two levers: one provided water sweetened with saccharin (an intense sweetener), and the other provided water laced with cocaine. After the mice had sampled both, the researchers watched to see which one they would prefer.

The results were shocking. Despite cocaine being a notoriously addictive drug, **94% of the mice chose the sweetness over the cocaine.** Even when the researchers significantly increased the dosage of the cocaine, the mice still went back for their "sweet fix." This study provides clinical proof that sugar is one of the most addictive substances on the planet.

## A Lifetime of Conditioning

When you realize the sheer power of that addiction, you start to see the world differently. Think about how deeply sugar is woven into our lives. Most of us were introduced to it as toddlers. We were rewarded with it for good behaviour and comforted with it when we were sad.

We grew up on a roller-coaster of sugar highs and devastating crashes. We've all seen the "screaming kid" in the grocery store aisle—that isn't just a tantrum; it is the sound of a body crying out for its next fix.

It is no wonder the world has become so overweight and lethargic. We weren't just "eating poorly"—we were being brought up on a substance more addictive than Class-A drugs. The only children who seem to escape the obesity trap are the ones who are exceptionally

active—the ones who manage to burn the fuel as fast as they consume it. But for the rest of us, the sugar stays, the addiction grows, and the cycle continues.

Once you accept that sugar is a drug, you can stop treating your "cravings" as a lack of willpower and start treating them as a chemical dependency that needs to be broken.

## CHAPTER 4

# The Best-U Nutrition Formula

You Are Not Full of Fat—  
You Are Full of Sugar

A Lion doesn't wake up  
to a bowl of oats; It hunts  
on an empty stomach.

While we use the term "fat" to describe excess body weight, it is almost always driven by our sugar intake. This is the "hidden" culprit behind the weight gain epidemic.

When you consume carbohydrates—whether it's a bowl of pasta, a slice of bread, or a sugary drink—your body can only use so much of it for immediate energy. Aside from the fibre, which passes through your system, every gram of sugar you don't burn must go somewhere.

## The Liver's "Repackaging" Plant

Your fat cells don't just "suck up" sugar directly. Instead, your body undergoes a chemical process called **De Novo Lipogenesis**. Essentially, your liver acts as a processing plant that takes excess sugar and chemically converts it into fat for long-term storage.

This means that the "fat" you see on the scale is actually **repackaged sugar**. You aren't just carrying extra weight; you are carrying a massive, stored surplus of the very substance your body is struggling to manage.

## Exhaling the Weight

When you switch to the Best-U plan, you stop the constant "sugar-to-fat" conversion. Your body finally gets the chance to open those storage lockers and use that energy. But here is the most fascinating part: when you finally start to burn that stored energy, you don't "poop" it out. You breathe it out. Through a chemical process, the stored energy is broken down into **Carbon Dioxide** (CO<sub>2</sub>) and water. You are quite literally exhaling your weight.

## The Best-U Healing Process

When you replace sugar with high-quality fat as your primary fuel, your body begins to heal almost immediately:

**Clearing the Backlog:** By stopping the sugar intake, you give your liver a break and allow it to start processing the fat already in storage.

**Cellular Hydration:** Your cells begin to retain water correctly again, ending the systemic dehydration caused by high sugar.

**Mental Acuity:** As your brain switches to a cleaner, more stable fuel source, "brain fog" disappears.

**Muscle Preservation:** We provide enough high-quality protein to ensure that while the sugar burns off, your muscle mass stays exactly where it belongs.

## The Clinical Proof

This isn't just theory; I see it in my clients every day. I've worked with four clients who had serious diabetic issues. One was pre-diabetic; after following the Best-U formula, his diabetes is **completely gone**. The other three have reached the lowest, healthiest blood sugar levels they have ever recorded.

Furthermore, two of my clients recently had their cholesterol checked. Their doctors were stunned, saying their levels were the best they had ever seen. Their advice was simple: "Whatever you are doing, keep

doing it!" It's a simple truth that guides everything we do: **Nothing tastes as good as healthy feels.**

## Soft Drinks: Not So Soft on the System

The name "soft drink" is a massive misnomer. These beverages are anything but soft on your body, your mental clarity, or your physique.

Drinking your sugar is one of the fastest ways to spike your insulin and trigger the fat-storage process. But it's even worse than that: if you have a soft drink with a meal that contains fat (like a burger or pizza), you are triggering that "40% Craving Rule" we discussed earlier. The sugar in the drink combined with the fat in the food bypasses your satiety signals, making you eat significantly more than you intended.

Remember: **one liter of fluid equals one kilogram of weight**. If your body cannot immediately burn those liquid calories, they are processed by the liver and stored as fat.

## The Best-U Alternative: The "Blood Orange" Hack

To break the sugar habit, you need a replacement that satisfies the palate without the metabolic cost. My favourite substitute is "Ice-Tea" done the Best-U way:

1. Take a large jug and add three cups of boiling water.
2. Steep three Blood Orange (or your favourite fruit flavour) tea bags.
3. Leave the bags in, top it up with cold water, and refrigerate. You end up with a delicious, vibrant, and naturally sweet-tasting drink with zero sugar and zero impact on your insulin levels.

## Over-Feeding: The Lethargy Loop

We often think that people stop exercising because they lack "willpower." However, science suggests that overeating actually causes the laziness.

A study titled "*High Fat High Sugar Diet Reduces Voluntary Wheel Running in Mice*" looked at this exact connection. The mice fed a High-Fat, High-Sugar (HFHS) diet didn't just consume more calories—they also **ran 28% less** than the group eating normal chow. Interestingly, their sex drive remained unaffected, but their desire for physical activity plummeted.

The conclusion is powerful: **Chronic overfeeding reduces the desire to move.** When you eat the wrong formula, you aren't just gaining weight; you are biologically "turning off" your motivation to be active. By changing the fuel, you don't have to "find" motivation—your body naturally wants to move again.

## Dehydration and Mental Acuity

Every client on the Best-U plan has seen a dramatic increase in their body-water percentage. This is one of the most consistent results I see, and it's arguably the most important for your brain.

My theory—which I've discussed with university researchers—is based on simple physics. The human body is mostly water, and water is a master conductor of electricity. Your brain consists of billions of neurons that communicate via electrical and chemical signals. These impulses rush along tiny fibres like electrical wires.

### The Conductivity Theory

If you are dehydrated, your "internal wiring" has higher resistance. Think back to a time when you were severely dehydrated—you felt sleepy, your eyes were drooping, and you couldn't think straight. Your "conductivity" was low.

When you are highly hydrated at a **cellular level**, the opposite happens. I'm not talking about having a stomach full of sloshing water; I'm talking about your cells actually absorbing and retaining the fluid.

### Why Best-U Hydrates Better

I believe that once you clear the excess sugar from your system, your cells can finally hold onto water effectively. High sugar levels cause systemic inflammation and "osmotic" pressure that often flushes water out of the places it's needed most. By switching to a fat-based energy system, your body becomes more conducive to retaining healthy cellular water.

The result? **Increased mental acuity.** You think faster, your memory is sharper, and that mid-afternoon "brain fog" disappears entirely. You aren't just losing fat; you are upgrading your brain's operating system.

## The Efficiency of Fuel: Digestion Times

One of the core pillars of the Best-U plan is a concept most diets completely ignore: **Digestion Time.** I have discovered that what you eat is only half the story; how fast it turns into energy is what determines whether you feel like a Ferrari or a broken-down truck.

Take one of my favourite dishes: **Cheesy Eggs.** Two eggs, a dollop of cream, butter, and tasty cheese. This 150g meal is delicious and incredibly satisfying. It contains roughly the same protein and energy as a steak sandwich and a bowl of fries.

The difference? The eggs are processed by your stomach in under an hour. Within 60 minutes, that food is converted into the amino acids and fuel your muscles need. The rest of the time until your next meal, your body isn't struggling with digestion—it's **healing and growing.**

Now, look at the steak sandwich and fries. That meal weighs about 500g (300% larger than the eggs) and can take up to **fourteen hours** to digest. Most people eat two more meals during that fourteen-hour

window. This creates a "blockage" in the digestive tract. Your system gets backed up, your stomach expands, and your body is stuck in a permanent "Food Coma" because it never finishes the first job before the next one arrives.

When you see someone with a large stomach, they aren't always "fat"—often, their fuel tank is just backed up. Even experienced cyclists sometimes have "distended" stomachs because they are constantly shoving slow-burning fuel into a system that can't keep up. By switching to fast-digesting, satisfying foods, you empty the system, reduce the physical size of your stomach, and sky-rocket your energy.

## The "Three Meals a Day" Myth

We have been conditioned to believe that we must eat three times a day. If you have cereal for breakfast, a steak sandwich for lunch, and pasta for dinner, it could take days for your body to fully process that volume. Unless you are an elite athlete burning thousands of calories an hour, you are essentially burying your engine in sludge.

I'm 52 years old, and my energy and strength are far greater now than when I was playing high-level rugby at 21. Back then, my dad would feed me a massive pre-match meal of bacon, eggs, and toast for "energy." I'd spend the game yawning and feeling sluggish, thinking I was being lazy. I wasn't lazy—my body was using all its power just to move that massive meal through my gut.

## Nature's Timing

Nature doesn't eat on a schedule.

- **The Lion** doesn't wake up to a bowl of oats; it hunts on an empty stomach, eats its fill, and then rests.
- **The Monkey** doesn't have cereal before climbing; it climbs, finds a banana, and then eats.

In the movie *Cinderella Man*, James J. Braddock wins world-class boxing matches while he is literally "starving" and poor. He fought with a clarity and desperation that disappeared once his stomach was full.

Ironically, we add food thinking it gives us immediate energy. It only gives you energy after it has been digested. Overweight people are often the most tired people in the room because their bodies are working 24/7 just to process a never-ending backlog of food.

## Starving vs. Hungry: The "Borborygmus" Secret

We often use the word "starving" incorrectly. You are not starving; you are simply hungry. **Starvation** only happens when your fuel tank is completely empty, you have zero body fat left, and your body begins to consume its own muscle for survival.

So, what about that rumbling in your stomach? We are taught that a growling stomach is a "warning" to eat immediately. This is a physiological phenomenon called **Borborygmus**.

Borborygmus is actually the sound of your digestive muscles moving liquid and gas through an empty chamber. Because the stomach is empty, the sound echoes. **This is a sound you should learn to love.** It means your body has finally finished digesting and is now switching over to the "reserve tank"—your stored fat.

When my stomach growls, I don't think "I need food"; I think **"Awesome, I am burning fat."** It's like the "burn" of the gym, but for your metabolism. If you can push through those few minutes of discomfort, your body begins to use "Rocket Fuel" (stored fat) instead of "Diesel" (digesting food), and that is when you start to feel amazing.

## Fasting: The Body's Self-Cleaning Mode

The best thing to do when you have overeaten is simple: Don't eat. This is the power of fasting.

When you go without food for over fourteen hours, your body enters a state called **Autophagy**. "Auto" means self and "phagy" means eat. Your body literally begins "self-eating," but it doesn't eat your healthy tissue—it cleans out damaged cells and regenerates new, healthy ones. It's an internal deep-clean.

The problem with most fasting plans is that they are mentally exhausting, and if you go too far, you risk burning muscle. The Best-U plan is designed to be the "Sweet Spot." We push the fasting window to the morning, so you aren't going to bed hungry (which is miserable). You might feel a bit of hunger for two hours before your first meal, but because that meal is **satisfying and high-calorie**, your brain stays motivated.

You can only lose weight if you fast at some point during the day. By timing it correctly, we ensure you get all the benefits of Autophagy and fat-burning without the mental burnout of traditional "starvation" diets.

## The Bridge: Coffee, Cream, and the Hunger Hack

One of the biggest hurdles in any nutrition plan is managing the morning gap before your first meal. This is where we use a specific "tool" to satisfy the body without breaking the metabolic momentum of your fast.

The hack is simple: first thing in the morning, have a coffee, tea, or sugar-free hot chocolate with a generous pour (**20–30ml**) of heavy cream or coconut cream. Alternatively, a single teaspoon of high quality peanut butter instead of the coffee.

### Why It Works

This is a biological "trick." Because the fat in the cream or peanut butter is so calorie-dense and nutrient-rich, your brain receives a

signal that you have consumed a substantial meal. It triggers satiety hormones that silence the "Feed Me!" voice for another 2–3 hours.

It is far better to consume 30ml of cream than to sit down to a full breakfast of toast and cereal. One keeps you in a fat-burning state; the other spikes your insulin and shuts down weight loss for the day. Use these "bridge" drinks as tools to glide effortlessly toward your first real meal.

## Protein: The 100-Gram Rule

Most people believe that the more protein they eat, the more muscle they build. This is a myth. Your body has a physiological limit on how much protein it can process at once—a ceiling known as **Protein Synthesis**.

Studies show that the human body can typically only absorb and utilize between **25 to 35 grams** of high-quality protein in a single "sitting" (a 1-to-2-hour window). To put that into perspective, the body processes fast-digesting proteins, like whey, at a rate of roughly 10 grams per hour.

### The Ideal Portion

The ideal amount of meat, fish, or tofu for a Best-U meal is **100 grams**. \* 100g of meat/fish/tofu contains roughly **23–27 grams of protein**.

- This hits the "Sweet Spot" for protein synthesis perfectly.

I used to eat far more than this, and you probably do too. But if you eat more than your body can synthesize, the excess stays in your digestive tract. It doesn't build more muscle; it just expands your stomach and sits there, slowing down your system. If your body truly needs more protein for a specific repair, it will pull from the amino acid pool already in your system.

### Choosing Your Protein for Volume and Speed

Not all protein sources are equal when it comes to the "Best-U" goal of reducing stomach volume while increasing satisfaction. Here is how they rank by protein density and efficiency:

| Food Source    | Protein Density (Approx) | Best-U Benefit                                  |
|----------------|--------------------------|-------------------------------------------------|
| Protein Powder | 83%                      | Fast processing; add cream for satisfaction.    |
| Eggs           | 50% Protein / 50% Fat    | Perfect balance; extremely fast to digest.      |
| Cheese         | 50% Protein / Fat        | High satisfaction; very low volume.             |
| Steak          | 27% Protein / Fat        | High energy; slower digestion.                  |
| Nuts           | 25% Protein / Fat        | Great "on the go" fuel; 50g can be a full meal. |
| Chicken        | 23% Protein / Fat        | Lean; moderate digestion time.                  |
| Fish           | 22% Protein / Fat        | Very fast digestion; great for evening meals.   |

**The Best-U Pro Tip:** Eggs, nuts, and cheese are the "triple threat." You get the protein and the fat in about half the physical volume of meat. This allows you to eat less, feel more satisfied, and shrink your "fuel tank" faster. I often make 50 grams of nuts my entire meal—it's fast, efficient, and keeps me in peak condition.

## CHAPTER 5

# Your Custom Nutritions Plans

Finding Your Sweet Spot:  
Formulas for Gents, Ladies,  
and Elite Performance

### The Beginner Nutrition Plan Formula

The Best-U formula is built on a simple, logical structure designed to work with your body's natural clock rather than against it. To start, you need to identify your "Final Fuelling Time."

Think about the last time you would realistically want to eat each night, including snacks. For example, if you eat dinner at 7:00 PM but find yourself reaching for snacks at 10:00 PM, then your "Last Meal" time is 10:00 PM.

**The first secret of Best-U: We replace "snacking" with a structured meal. ###** The 3-Hour Rhythm Once you have your end time, we work backward in 3-hour increments.

- **Gents:** I suggest four meals per day.
- **Ladies:** I suggest three meals per day.

If your last meal is at 10:00 PM, your schedule looks like this:

1. **10:00 PM:** Final Meal
2. **7:00 PM:** Meal Three
3. **4:00 PM:** Meal Two
4. **1:00 PM:** First Meal

Why three hours? Research shows that three hours is the average window when the body begins to signal hunger. By eating the correct, nutrient-dense food **before** you get hungry, we prevent the "hunger panic" that causes people to fall off the wagon. We stay ahead of the curve.

## The Fasting Window

With this schedule, you are fasting for approximately 15 hours every day. While that sounds daunting, remember that you are sleeping for at least eight of those hours. The "Coffee with Cream" tool we discussed earlier will easily bridge the gap from when you wake up until 1:00 PM.

I've noticed a distinct pattern in my clients:

- **Gents** usually see the best results with a **1:00 PM to 10:00 PM** window. Men tend to prefer eating later in the evening.
- **Ladies** often prefer an earlier schedule, with **12:00 PM, 3:00 PM, and 6:00 PM** being the most successful times.

My theory on this is rooted in nature. For thousands of years, the provider brought food home for the family; the women and children ate first, and the men ate later. We are simply leaning into those natural biological instincts.

## The Psychological Shift

Starting your first meal at 1:00 PM might feel "too late" at first. You might instinctively worry that you won't have the energy to survive the morning. This is entirely psychological. You have plenty of fuel in your "reserve tank" (your stored fat)—this schedule is simply how we trick the body to finally use it.

You cannot lose weight without being hungry at some point in the day. That is the price of entry. However, by moving that hunger to the two hours before your first meal—and supporting yourself with the "Coffee Hack"—it becomes a minor inconvenience rather than a struggle. It is much easier to manage a little hunger in the afternoon than it is to go to bed with an empty stomach.

**This is the formula. By sticking to this daily rhythm, you will reach your goals while staying completely satisfied.**

## Gents Beginner Eating Plan

**First thing:** Glass of water.

**8am and 11am:** Have a coffee with a pour of cream or coconut cream. This satisfies the hunger and starts getting your body used to using fat as energy. I have three a day, usually all before my first meal. Use these as your hunger control. Every coffee with a good pour of cream or coconut cream (think less than a shot of cream) this will make your hunger disappear for 2-3 hours. The longer you leave the first meal, the better the result. This empties your fuel tank that is currently over full.

### 2PM: 1ST MEAL

#### 200 grams Total.

- **Protein:** Around 100 grams of meat / fish / tofu is ideal as your body can only process 30g of actual protein per meal, there is around 30 grams of protein in 100g of Fish or chicken or red meat (not ideal). The goal is to have 30 grams of actual protein per meal. I cook this in butter.
- **Vegetables:** 100g of green vege (Broccoli is Best).
- **The Sauce:** A Fatty or cheesy sauce to cover the meal.
- **Tip:** The less fat / energy you consume, the more you will burn. The trick is to add enough fat that you are satisfied. The hunger satisfaction is the MOST important part. The plan does not work if you are still hungry. Get really good at making fatty sauces, this will make the plan easier for you. You will learn how to monitor this naturally as you learn to listen to your body.

#### Alternative Options:

100g of Meat / Fish / Tofu and half an Avocado (100 grams). I achieved my Best results with this formula using 100g of smoked salmon with half an avocado.

**For greater weight loss:** 50 grams of nuts, eggs or cheese as these foods are double in protein and fat than the foods above, but far less in volume.

**The "Batch Habit":** A good habit is to make a large meal, 200 grams of fish or chicken cooked in butter with 200 grams of greens and a fatty sauce, then halve it. Eat half, then heat up the other half for another meal. Easy.

### 5PM: 2ND MEAL

Same as above or half a 150 gram bag of nuts. (This is my favourite option. 75 grams of nuts is half protein / fat, but very small in volume. It satisfies the hunger and the nutrition requirements, plus easy to eat on the go) or 50 grams of cheese.

### 8PM: 3RD MEAL

**200 grams Total. \* Protein:** Around 100 grams of meat / fish / tofu is ideal as your body can only process 30g of actual protein per meal, there is around 30 grams of protein in 100g of Fish or chicken or red meat (not ideal). The goal is to have 30 grams of actual protein per meal. I cook this in butter.

- **Vegetables:** 100g of green vege (Broccoli is Best).
- **The Sauce:** A Fatty or cheesy sauce to cover the meal.

#### Alternative Options:

- 100g of Meat / Fish and half an Avocado (100 grams). I achieved my Best results with this formula using 100g of smoked salmon with half an avocado.
- **For greater weight loss:** 50 grams of nuts, eggs or cheese as these foods are double in protein and fat than the foods above, but far less in volume.

## 11PM: 4TH MEAL

Same as above or half a 150 gram bag of nuts. (This is my favourite option) or even 50 grams of cheese with nut and seed crackers. These are also around half protein / fat.

### Important Principles for Success:

- **Think Volume!** The less you eat, the more you will lose. Fat is your friend. It makes you feel Satisfied and gives you energy!!
- **Experiment:** To get greater results, start experimenting with the amount of fat you have. i.e. no fat means you will burn more fat, but you will feel super hungry, so the goal is to find that balance between the right amount of fat to sustain your hunger, and give you energy. So experiment by getting the exact right amount of fatty sauce / gravy / cheese sauce that isn't drowning the meal, just slightly covering it so it satisfies your hunger and energy requirements.
- **The 200g Rule:** The whole meal needs to be near 200 grams. This includes the sauce. Volume is more important than calories.
- **The Peanut Butter Tool:** If you are still hungry after this meal, have a teaspoon or two of peanut butter. It is half fat / protein. It should satisfy your hunger and take you through to your next meal. Each teaspoon is around 5 grams (depending on how much you put on it).
- **Listen to your Body:** If you are not hungry at your first or last meal, then miss that meal. It means your body has all it needs, and your stomach has shrunk. You could just have a teaspoon of Peanut butter here. Use peanut butter as your tool to control your hunger. It works.

## Ladies Beginner Eating Plan

**First thing:** Glass of water.

**9am and 11am:** Have a coffee with a pour of cream or coconut cream. This satisfies the hunger and starts getting your body used to using fat as energy. I have three a day, usually all before my first meal. Use these as your hunger control. Every coffee with a good pour of cream or coconut cream (think less than a shot of cream) this will make your hunger disappear for 2-3 hours. The longer you leave the first meal, the better the result. This empties your fuel tank that is currently over full.

## 12PM: 1ST MEAL

200 grams Total.

- **Protein:** Around 100 grams of meat / fish / tofu is ideal as your body can only process 30g of actual protein per meal, there is around 30 grams of protein in 100g of Fish or chicken or red meat (not ideal). The goal is to have 30 grams of actual protein per meal. I cook this in butter.
- **Vegetables:** 100g of green vege (Broccoli is Best).
- **The Sauce:** A Fatty or cheesy sauce to cover the meal.
- **Tip:** The less fat / energy you consume, the more you will burn. The trick is to add enough fat that you are satisfied. The hunger satisfaction is the MOST important part. The plan does not work if you are still hungry. Get really good at making fatty sauces, this will make the plan easier for you. You will learn how to monitor this naturally as you learn to listen to your body.

### Alternative Options:

- 100g of Meat / Fish / Tofu and half an Avocado (100 grams). I achieved my Best results with this formula using 100g of smoked salmon with half an avocado.

- **For greater weight loss:** 50 grams of nuts, eggs or cheese as these foods are double in protein and fat than the foods above, but far less in volume.

**The "Batch Habit":** A good habit is to make a large meal, 200 grams of fish or chicken cooked in butter with 200 grams of greens and a fatty sauce, then halve it. Eat half, then heat up the other half for another meal. Easy.

### 3PM: 2ND MEAL

Same as above or half a 150 gram bag of nuts. (This is my favourite option. 75 grams of nuts is half protein / fat, but very small in volume. It satisfies the hunger and the nutrition requirements, plus easy to eat on the go) or 50 grams of cheese.

### 6PM: 3RD MEAL

**200 grams Total. \* Protein:** Around 100 grams of meat / fish / tofu is ideal as your body can only process 30g of actual protein per meal, there is around 30 grams of protein in 100g of Fish or chicken or red meat (not ideal). The goal is to have 30 grams of actual protein per meal. I cook this in butter.

- **Vegetables:** 100g of green vege (Broccoli is Best).
- **The Sauce:** A Fatty or cheesy sauce to cover the meal.

### Alternative Options:

100g of Meat / Fish and half an Avocado (100 grams). I achieved my Best results with this formula using 100g of smoked salmon with half an avocado.

**For greater weight loss:** 50 grams of nuts, eggs or cheese as these foods are double in protein and fat than the foods above, but far less in volume.

### 9PM: 4TH MEAL

Same as above or half a 150 gram bag of nuts. (This is my favourite option) or even 50 grams of cheese with nut and seed crackers. These are also around half protein / fat.

### Important Principles for Success:

- **Think Volume!** The less you eat, the more you will lose. Fat is your friend. It makes you feel Satisfied and gives you energy!!
- **Experiment:** To get greater results, start experimenting with the amount of fat you have. i.e. no fat means you will burn more fat, but you will feel super hungry, so the goal is to find that balance between the right amount of fat to sustain your hunger, and give you energy. So experiment by getting the exact right amount of fatty sauce / gravy / cheese sauce that isn't drowning the meal, just slightly covering it so it satisfies your hunger and energy requirements.
- **The 200g Rule:** The whole meal needs to be near 200 grams. This includes the sauce. Volume is more important than calories.
- **The Peanut Butter Tool:** If you are still hungry after this meal, have a teaspoon or two of peanut butter. It is half fat / protein. It should satisfy your hunger and take you through to your next meal. Each teaspoon is around 5 grams (depending on how much you put on it).
- **Listen to your Body:** Also, if you are not hungry at your first or last meal, then miss that meal. It means your body has all it needs, and your stomach has shrunk. You could just have a teaspoon of Peanut butter here. Use peanut butter as your tool to control your hunger. It works. The plan teaches U to listen to your Body! If you are not hungry, don't eat!!

## Gents Intermediate Eating Plan

After a few weeks on the beginner plan, you will feel less and less hungry. You will start to feel the benefits of eating less. Your energy will be greater. You will feel lighter and stronger. Again, the hardest part of losing weight is the mental battle. By now you should feel more in control with fasting.

Now let's take it to the next level. You will move to only two meals. Good amounts of protein and fat only. The coffee with cream or coconut cream or a teaspoon of peanut butter will trick your body into thinking it has had a full meal. This will take you to the next level of weight loss while maintaining muscle. Also, giving a greater period of fasting. **21 Hours of no major food and 3 hours of eating.** The cell regeneration and fat loss is significantly enhanced while you feel amazing and satisfied. You can also go straight to this stage instead of the beginner plan to get greater results.

- **9am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **11am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **1pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **3pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **6pm: 1st Meal.** Protein and fat. Nuts or Meat / Fish / Eggs with cheese, or cream, butter, avocado etc.
- **9pm: 2nd Meal.** Protein and fat. Nuts or Meat / Fish / Eggs with cheese, or cream, butter, avocado etc.

## Women's Intermediate Eating Plan

The intermediate plan for ladies increases the fasting window while focusing on high-density nutrition to maintain energy and mental acuity.

- **9am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **11am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **1pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **3pm: 1st Meal.** Nuts or hot chicken (protein and fat).
- **6pm: 2nd Meal.** Protein and fat. Nuts or Meat / Fish / Eggs with cheese, or cream, butter, avocado etc.
- **9pm:** Tea or sugar free chocolate with cream or coconut cream or a teaspoon of peanut butter.

### Key Intermediate Principle:

At this stage, you are leaning heavily on your "Bridge" tools (coffee/cream/peanut butter). Because your body is now adapted to using fat as energy, these small hits of high-calorie fat are all your brain needs to stay satisfied during the 21-hour fasting window.

## Gents Advanced Eating Plan (NOMAD)

Once you have gotten used to only two meals you can switch to the plan I am constantly on. **NOMAD - (Nuts.One.Meal.A.Day).** Nothing I have ever done has made me feel so amazing and given me such incredible results. So my body is in a bio hacked tricked fasting state 23 hours a day. I just turned 52 and I am far fitter, stronger and healthier than I have ever been. The fat is falling off me and increasing my muscle.

- **9am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **11am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **1pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **3pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **6pm: The One Meal.** Protein and fat. Nuts, 200-300g of Meat / Fish / Eggs with cheese, or cream, butter, avocado etc.
- **9pm:** Teaspoon of peanut butter

## Women's Advanced Eating Plan

This plan follows the same principle of a singular, nutrient-dense fuelling window, using bridge tools throughout the day to maintain peak mental and physical performance.

- **9am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **11am:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **1pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **3pm:** Coffee with cream or coconut cream or a teaspoon of peanut butter
- **6pm: The One Meal.** Protein and fat. Nuts, 200-300g of Meat / Fish / Eggs with cheese, or cream, butter, avocado etc.
- **9pm:** Tea or sugar free chocolate with cream or coconut cream or a teaspoon of peanut butter

## The NOMAD Mindset

By this stage, your body is a master at burning its own stored energy. You are essentially using your "One Meal" to provide the essential proteins and nutrients required for muscle maintenance, while the small hits of fat (cheese, cream, or peanut butter) keep your brain fueled and satisfied throughout the day. You are living in a state of constant cell regeneration and high-octane energy.

## The Perfect Day

If you implement the formula and do all the Best things you will achieve the Best results. It takes a little bit of organisation, this is my perfect day, if you can stick to this perfect day on the days of strength training everything will fall into place a lot faster.

### Morning

- Coffee with cream
- Creatine 10g
- Walk for an hour

### Lunch time

- Coffee with cream or coconut cream

### Afternoon

- Coffee with cream or coconut cream or teaspoon of peanut butter

### Evening

- Workout
- Meal – try to have 6 eggs (this not only gives you protein but will give you 90% of your daily vitamin needs)
- Meal again if hungry
- Snack of nuts, cheese, dark chocolate, peanut butter

## Food Options and Digestion Times

The following list categorizes your protein and fat options from **Fast to Slow** digestion. By choosing the faster options, you dramatically reduce the "Postprandial Dip" (the food coma).

Fast-digesting foods prevent "backups" in your system, allowing your stomach to shrink naturally. Because food isn't sitting in your gut for 14+ hours, it doesn't have time to ferment and turn into noxious methane and hydrogen gas. Switching to these options often means an end to burping and wind.

### Protein Options (Target: 100 grams)

- **Fast Digesting:** Protein Powder, Eggs.
- **Medium Digesting:** Dairy (Cheese, Cottage Cheese), Nuts and Seeds (Almonds, Walnuts, Macadamias, etc.), Legumes and Beans (Lentils, Chickpeas, Tofu), Fish and Seafood (Salmon, Prawns, Shellfish), Poultry.
- **Slow Digesting:** Red Meats (Beef, Lamb, Veal, Pork, Kangaroo).

### Fat Options (Target: Up to 100 grams including greens)

**Goal:** Find the "sweet spot" where you are satisfied but under 100g total volume. Sauces are the most efficient way to achieve this.

**Fast Digesting:** Olive Oil, Flaxseed Oil, Avocado Oil, Egg Yolks, Cream (in sauces), Butter (in sauces).

**Medium Digesting:** Seeds (Sesame, Chia, Pumpkin), Avocados (Guacamole), Cheese, Nuts.

## The "Don't Eat" Rule

If you reach your scheduled mealtime and are **not hungry**, do not eat.

This is a clear signal that your body is happy using its excess fuel. This is how you finally "empty the tank." The Best-U plan is about learning to listen to your body rather than a clock. While you must eat

your protein and fat to maintain muscle and mental sanity, remember that if you are currently overweight, your body has plenty of "back-up" fuel it can use.

**The Peanut Butter Safety Valve:** If you feel a spike of hunger between meals, use nut butter. One teaspoon of this rich, high-fat/protein food will satisfy the craving and get you through to your next window easily.

## The "Empty Bucket" Theory (Vegetables)

People often ask: *"What about vegetables? Is there enough in the plan?"*

My answer is simple: Most people already have far too much food sitting in their digestive tract. It is better to use the "old food" currently in your system than to add more—even if that new food is "healthy."

Imagine a bucket full of old food. If you leave it there, it decomposes. It smells, goes rotten, and creates gases. This is exactly what happens in a backed-up digestive system. These noxious gases are what cause burps and wind. I never experience these anymore because I have no excess waste; the food doesn't stay in my system long enough to rot.

### Clean Your System First

People spend a lot of money on probiotics to add "good bacteria" to an unsettled bucket. But do you know what the cleanest, healthiest bucket is? **An empty one.** The best thing you can do for your health is to empty that noxious bucket first. Once your system is clear:

1. Your stomach will have shrunk.
2. The "rotting" gases will be gone.
3. You can then begin adding back fresh vegetables and fruits.

Remember: Vegetables are sugar. They are "good" sugar, but they are still energy. Your body will thank you for clearing the path before you start fuelling again. If you are worried about nutrients and vitamins, the next chapter will explain exactly why you have nothing to fear.

## Vitamins and Nutrients: The Meat and Fat Myth

Most people believe that you must consume large amounts of vegetables to get the nutrients and vitamins required to be a healthy human. This is simply not correct.

A diet focused on high-quality protein and healthy fats is actually more nutrient-dense than a vegetable-only diet. In fact, there are essential vitamins (like B12) that you can only get from animal products. I have designed the Best-U plan to incorporate all thirteen essential vitamins within your daily intake.

### The Two Types of Vitamins

- **Fat-Soluble (A, D, E, K):** These are stored in your fatty tissues and are absorbed by the body alongside dietary fats.
- **Water-Soluble (C and the B-Complex):** These must be replenished regularly because they are not stored; they are removed from the body when you urinate.

### The Essential Vitamin List

- **Vitamin A:** Essential for cell growth, healthy skin, hair, and vision.  
Best-U Sources: Salmon, cold-water fish, egg yolks, and dairy.
- **Vitamin D:** Builds strong bones and teeth; aids calcium absorption.  
Best-U Sources: Butter, egg yolks, fatty fish, and sunlight.
- **Vitamin E:** A powerful antioxidant that maintains muscles and red blood cells.  
Best-U Sources: Eggs, vegetable oils, nuts, and seeds.
- **Vitamin K:** Critical for blood clotting.  
Best-U Sources: Spinach, broccoli, green leafy vegetables, and liver.

- **Vitamin C:** Strengthens blood vessels, supports immunity, and aids wound healing.  
Best-U Strategy: While found in citrus, I recommend high-quality Vitamin C tablets. They provide the exact same benefits as fruit but with zero sugar.
- **Vitamin B1 (Thiamine):** Maintains digestion and nerve function.  
Best-U Sources: Pork, legumes, nuts, seeds, and eggs.
- **Vitamin B2 (Riboflavin):** Supports adrenal function, vision, and energy metabolism.  
Best-U Sources: Lean meat, poultry, eggs, and dairy.
- **Vitamin B3 (Niacin):** Can lower cholesterol and promotes normal growth.  
Best-U Sources: Lean meats, poultry, seafood, milk, and eggs.
- **Vitamin B5 (Pantothenic Acid):** Normalizes blood sugar and aids energy metabolism.  
Best-U Sources: Found in almost all foods.
- **Vitamin B6 (Pyridoxine):** Essential for nerve function and protein metabolism.  
Best-U Sources: Meat, fish, poultry, and leafy greens.
- **Vitamin B7 (Biotin):** Plays a major role in a healthy metabolism.  
Best-U Sources: Egg yolks, soy beans, and nuts.
- **Vitamin B9 (Folate):** Crucial for DNA synthesis and preventing birth defects.  
Best-U Sources: Liver, leafy greens, avocados, legumes, and eggs.
- **Vitamin B12 (Cobalamin):** Required for red blood cells and nerve fibres.  
Best-U Sources: All animal products and eggs.

## The Best-U "All-In-One" Checklist

To make this plan easy, you don't need to track thirteen different numbers. If you include these four "Super foods" in your daily intake, you will cover your requirements:

1. **Eggs:** These are a multivitamin in a shell. They contain A, D, E, K, B1, B2, B3, B5, B6, B8, B9, and B12. Eating just two eggs covers 30% of your daily vitamin requirements.
2. **Nuts:** High in B-vitamins, Vitamin E, and essential minerals.
3. **Avocados:** Packed with healthy fats and Folate (B9).
4. **Broccoli:** Your primary source for Vitamin K.

**Summary:** If you eat **Meat, Eggs, Nuts, Avocados, and Broccoli, and take a Vitamin C tablet**, you are not just "surviving"—you are giving your body a higher grade of nutrition than almost anyone else on a standard "balanced" diet. You get all the health, with none of the sugar.

## The Cholesterol Myth

We have been told that cholesterol is bad for you. This could not be further from the truth. Yes, there is bad cholesterol from fast foods. But whole foods that contain cholesterol like eggs could not be better for you. They are the building blocks for the two most important things we need. Our brain and our testosterone (and yes women have testosterone as well. See below).

Testosterone is synthesized from cholesterol. Cholesterol acts as the essential precursor for all steroid hormones, including testosterone

The human brain is the most cholesterol-rich organ, containing about 20%–25% of the body's total cholesterol despite representing only 2% of total body weight.

It is crucial for neuron communication (synapses), membrane repair, and insulating electrical signals.

This is something I did not know. I always thought women produced estrogen instead of testosterone, but I was wrong. Yes, women have testosterone, which is essential for health, although they produce it in lower amounts than men, typically about 1/10th to 1/20th the level. Produced by the ovaries and adrenal glands, it supports sexual function, bone density, muscle mass, and mood.

It helps maintain libido, energy levels, and bone strength, and acts as a precursor for estrogen production.

## Water: Your High-Performance Coolant

As you flush the excess sugar from your system, your body's demand for water will increase dramatically. Every client on the Best-U plan has seen their body-water percentage rise significantly—and to be clear, I am talking about cellular hydration, not just the fluid sitting in your stomach.

If you don't increase your intake, you will feel tired, lethargic, and falsely hungry. Most of the time, when we think we need food, our body is actually crying out for water.

### The Best-U Hydration Schedule:

- First thing: One glass to wake up the system.
- Before every meal: One glass to aid digestion.
- Workouts: One glass before and one glass after.
- Before sleep: One glass. (In my experience, many sleep issues are actually rooted in night-time dehydration.)

**The Best-U Pro Tip:** don't put diesel in your Ferrari. I recommend distilled water. You can purchase a water distiller inexpensively; they remove 99.9% of the chemical and impurities, making the water far cleaner than standard tap or bottled options. You can also buy bottled distilled water from most supermarkets.

## Coconut Water

If I am on the run and do not have access to distilled water (Not every shop sells it) I buy coconut water. Coconut water is a nutrient-rich, low-calorie liquid (95% water) found inside young coconuts, primarily composed of water, electrolytes, and simple carbohydrates. And includes high levels of potassium along with sodium, magnesium, calcium, and phosphorus. It contains 4-5% carbohydrates (sugars), negligible fat and protein.

- It is rich in potassium, magnesium, calcium, and sodium, making it a good hydrating agent.
- It contains small amounts of Vitamin C, B-complex vitamins (thiamin, riboflavin, niacin).
- It also contains minor amounts of amino acids, enzymes, and antioxidants.

Making it not only the perfect drink on the run, but something to add to your weekly plan.

I personally drink at least a litre a day. It is cost effective, available everywhere, and tastes amazing.

## The Magic Potion

After extensive research and self-experimentation, I have developed a "Magic Potion" that has dramatically boosted my energy. This mixture uses natural ingredients known for their anti-inflammatory and metabolic benefits. I recommend this once a week.

### The Formula:

30ml of Water  
 1 x Tablespoon Apple Cider Vinegar  
 1 x teaspoon Natural Honey  
 1 x Tablespoon Lemon Juice

1/4 teaspoon Turmeric  
 1/4 teaspoon Cayenne Pepper  
 1 x Tablespoon Baking Soda (Add this last—it will foam up! Stir until mixed and drink immediately.)

### The "Daily Stack":

In addition to the potion, I take the following to maintain peak performance:

- **30ml Water** mixed with **10g-15g Creatine** (for muscle and brain health).
- **Vitamin D3 / K2** (for bone health and immunity).
- **Magnesium Glycinate** (for muscle recovery and relaxation).

### Before Bed:

- **1 x Melatonin** (to ensure deep, restorative sleep).

## A Good Night's Sleep?

A very interesting phenomena happens with this plan in regards to sleep. If you do as I do and only eat the super fast digesting foods (Eggs, cheese, nuts, fish) your body processes these foods so fast that you actually require less sleep. I used to need 8-10 hours of sleep a night, and I would still feel groggy. Since switching to the Best-U diet I have found that I am jumping out of bed with around 6 hours sleep. I am waking up way before my alarm feeling completely invigorated. My body is no longer struggling trying to digest the slow digestion time foods.

### The benefits of a good sleep

Good sleep is essential for physical and mental health, providing benefits such as enhanced cognitive function, better memory consolidation, improved immune system strength, and weight management. It reduces risks of chronic conditions like heart disease and diabetes, improves mood regulation, and lowers stress, essential for overall well-being and longevity.

- Quality sleep enhances alertness, focus, memory, and cognitive performance. It helps process emotions, improves mood, and reduces the risk of mental health conditions like anxiety and depression.
- Sleep boosts the immune system, helping the body fight illnesses
- It regulates blood sugar and metabolism, reducing risks of diabetes, high blood pressure, and cardiovascular diseases.
- Adequate sleep regulates hormones that control appetite (ghrelin and leptin), helping to prevent obesity.
- Sleep facilitates muscle repair, tissue growth, and removes toxins from the brain.
- Better sleep improves reflexes, athletic performance, and decision-making, reducing the risk of accidents.

Also many research studies have shown that unplugging your wifi router and charging your phone in a room far away from where you sleep will dramatically improve the quality of your sleep. I have experimented this on myself and can attest to the results.

## Alcohol: The Greatest Challenge

The rule is simple: **The less you drink, the better the result.** Every beer or glass of wine is effectively a doughnut.

### Think Volume

A beer is 330ml. A shot of Vodka on the rocks is only 30ml. That means a beer is eleven times the volume of a spirit.

- If you have three Vodkas, that is 90ml.
- To get the same alcohol from beer, you would drink nearly a litre (a KG!).

This is why in the movies they drink Martinis; they are just two shots of Vodka (60ml). You never see James Bond or the Bond girls

drinking beer—it's Martinis or Champagne! **The less volume you have, the less weight you put on.**

### The Best-U Drink List:

- **White Spirits:** Vodka, Tequila, or others on the rocks with lime is best.
- **Wine:** Dry white (low sugar). Shiraz, as it stands, has around 20g of sugar per bottle.
- **Champagne:** Choose "Brut," which means dry/low sugar.
- **Beer:** If you must, low-carb beer is Best. One normal beer has 10–12x the carbs of a low-carb beer.

## On-The-Run Meals

Dining out is easy if you follow the **Protein + Greens + Fat formula**. Fat replaces carbohydrates for energy (No rice, bread, wheat, or potatoes).

### The Half-Plate Rule:

When your meal arrives, halve it on the plate. Eat half now, and get the waiter to put the other half in a takeaway container for your next meal.

- **Restaurants:** Order Chicken or Tofu with greens and a fatty sauce (gravy, beurre blanc, hollandaise, or curry).
- **Burgers:** Get a burger from your local takeaway (avoid big chains) with salad. Don't eat the bun. Better yet, order it "bunless."
- **Indian:** Order a curry with **no naan or rice**. The sauce becomes your energy.
- **Quick Picks:** 100 grams of fried chicken; Sashimi (100g) with half an avocado; 75 grams of nuts (I keep a pack of cashews in the car).

- **The Emergency Kit:** Keep a tub of Nut butter in the car. Eat until Satisfied—You won't need much!

## Recipes: Fast (Digesting) Food

These go-to recipes are quick, low-cost, and fast-digesting. They tick every box for energy, protein, taste, and satisfaction.

- **Cheesy Eggs (The Favourite):** Four eggs in a bowl with a large dollop of cream. Fold, then pour into a pan with melted butter. Sprinkle tasty cheese on top. Serve.
- **Ceviche Kokanda:** Cover fish in lemon or lime juice for 3 hours. Mix in a separate bowl with spring onion, cubed tomato, and cucumber. Add salt, pepper, the fish, drain off the juice.
- **Best-U Chowder:** Melt 400g butter with chopped celery, garlic, salt, and pepper. Add 1L chicken stock and boil. Add a bag each of defrosted King Prawns and marinara mix. Simmer 10 mins. Add 500g fresh fish and 300ml cream. Simmer 10 mins and serve.
- **Smoked Salmon Sashimi:** Use half a vacuum pack of Salmon with half an avocado, soy, and wasabi.
- **Smoked Salmon Eggs:** Mix 1/4 pack of salmon with half an avocado. Serve with two egg cooked in butter. (Swap salmon for Ham, Chicken, or Tofu if preferred).
- **Sashimi:** Buy fresh Salmon, cut into Sashimi-sized pieces. Serve with Soy, Wasabi, and half an avocado.
- **Cheese Soufflé:** Pre-heat oven to 170. Butter a metal bowl and cover the bottom with tasty cheese. Whisk 6 eggs with a pour of cream until aerated. Pour over the cheese and bake until golden brown. (Makes four meals).

## Recipes: Medium (Digesting) Food

- **Best-U Platter:** A board with salmon, cheeses, pate, olives, nut seed crackers, sun-dried tomatoes, and deli meats. Rule: Only eat 100 grams worth.
- **Best-U Chicken Mushroom Soup:** Melt 100g butter, add a bag of mushrooms, and cook until soft. Add two cans of cream of mushroom soup and boil. Add the meat of a whole cooked chicken (skin included), 200ml cream, herbs, salt, and pepper. Simmer 10 mins.
- **Best-U Chicken Chinese Corn Soup:** Melt 100g butter. Add two cans of cream of Chinese Sweet Corn soup and the meat of a whole cooked chicken (skin included). Add salt, pepper, and 200ml cream. Boil, then simmer for 10 mins.

## The Feast Night (The 90/10 Rule)

I am a big believer in a **Feast Night**. Psychologically, it is vital to have a reward to look forward to. If you have stuck to the plan for the majority of the week, give yourself that evening off.

**Note: This is a feast night, not a cheat day.** You can have anything you want for that evening—the meal that isn't on the plan and the alcohol you've been avoiding. The trick is to plan it in advance. If you have an event on Saturday, make that your night. People will be blown away when you start looking amazing while still eating and drinking what you want at the party.

I call this the **90/10 Rule:**

- If you stick to the plan 90% of the time, that 10% "off the wagon" is easily covered by your metabolic momentum.
- It keeps you mentally satisfied.
- Most of my clients go crazy on their first few feast nights, but after seeing the scales the next day, they realize it may not have been

worth it. They naturally begin to "self-police" and make the next one more controlled. That is exactly how the plan works.

## Preparation: Setting Up for Success

The easiest way to stick to the plan is good preparation. Before you start, take these steps:

- **Clear the Deck:** Give away any foods that do not fit the plan. Get rid of the sugar and carbs. If they are not in your cupboard or fridge, U will not be tempted.
- **Stock the Engine:** Go to the supermarket and buy your favourite foods from the Protein/Fat list. Ideally, choose ingredients closer to the top of the Fast Digesting list.
- **Think Ahead:** Plan tomorrow's meals tonight. I recommend making recipes in bulk that fit the formula.
- **Heat and Eat:** Separate your bulk meals into 200g portions and freeze or refrigerate them. This makes it effortless to grab a meal and go.

**Remember:** If you are still hungry after a portioned meal, use your safety valve: a teaspoon or two of peanut butter. It works!

## Parasites

One of the scary things about being over-weight, or having your bucket over full is that in that bucket of rotting food Parasites will start to grow. But do not stress, they can easily be eradicated and when they do you will feel so much better.

Parasites in the human body live off the host, stealing nutrients, increasing hunger and causing damage, which leads to symptoms like chronic diarrhea, abdominal pain, nausea, and fatigue. They can reside in the intestines or migrate to other tissues, causing severe issues like anaemia, skin rashes, and nutrient deficiencies.

They can cause infections that can trigger rashes, hives, eczema, and unexplained muscle or joint aches. Also "Brain Fog": Parasites release toxins that can lead to difficulties with concentration, memory problems, and slow thinking.

Along with persistent, unexplained fevers and swollen lymph nodes which can indicate an infection.

Some infections cause insomnia or teeth grinding (bruxism).

Some parasites enter the bloodstream to invade the liver, lungs, or brain, potentially causing serious, long-term damage. They can cause Insomnia and Mood Swings: Restless sleep, teeth grinding at night, and increased anxiety or depression can be associated with toxic build-up from parasites

Parasites can significantly affect brain function and hunger to create symptoms such as chronic hunger and food cravings. When I was 115kg the voice that said "feed me" all the time I believe is a big part of that is the parasites tricking your brain to eat more, to feed them. The smaller your fuel tank, the lower this voice becomes. Do not worry, this is easily fixed with the solution below. You will feel amazing very quickly when you start down the path of cleansing your system. You will feel like a new person. You will feel stronger mentally and physically.

They have also been linked to increased risk of suicide and mood disorders such as depression and anxiety. This is easily fixed and you will feel amazing once your body is cleansed.

## Getting Rid of Parasites

The easiest way to get rid of parasites is a combination of three things.

1. Go to a herbal store and get wormwood and black walnut pills. These worked for me.

2. The magic potion. The Cayenne pepper in the potion along with the other ingredients seem to combine and froth up and you can feel it cleansing your system.
3. Fasting. This one is harder because if you have parasites they will be releasing toxins into your brain and system that make you hungry, and when you fast they sense you are trying to lose weight so they double down and increase the toxins to make it harder to fast. But if you fast along with the first two processes above it is dramatically easier. Using the coffee with cream or the teaspoon of peanut butter dramatically helps this process.

## Creatine

I take zero drugs or unnatural supplements, and I am the strongest I have ever been. Everything I take is 100% natural. The one product that I have taken in the last year that has dramatically improved my performance, cognitive function, and memory is Creatine. It is the most researched health product on the market, and many doctors and health specialists are raving about its benefits for men, women, and especially as we get older.

According to the Cleveland Clinic, creatine isn't just for body-builders; it is a fundamental tool for anyone looking to optimize their health span. Here is why it's a game-changer:

### Benefits of Creatine

Creatine is often misunderstood as a "gym-bro" exclusive, but it remains one of the most rigorously studied supplements in the nutritional world. According to the Cleveland Clinic, its benefits extend far beyond the weight room, impacting everything from cellular energy to cognitive longevity.

Here is a breakdown of why this compound is considered a gold standard for performance and healthy aging.

### 1. Amplified Strength and Power

When paired with resistance training, creatine is a powerhouse for building lean muscle mass. It facilitates higher training volumes by allowing you to push through those final, critical repetitions that drive hypertrophy and functional strength.

### 2. The ATP "Turbo-Charge"

At a cellular level, creatine increases the body's stores of phosphocreatine (PCr), which is essential for the rapid production of Adenosine Triphosphate (ATP). This provides the immediate energy needed for short, explosive bursts of activity—high-intensity intervals.

### 3. Accelerated Recovery and Resilience

Data from the Cleveland Clinic suggests that creatine helps mitigate muscle inflammation and cellular damage. By promoting faster tissue repair, it reduces downtime between intense sessions, helping you maintain a consistent training protocol.

### 4. Cognitive Processing and Brain Health

One of the most exciting areas of emerging research is the "brain-muscle" connection. Creatine supports the energy demands of the brain, with studies showing improved memory and cognitive processing—particularly in older adults or during periods of mental fatigue.

### 5. Hydration and Injury Prevention

Contrary to the myth that it causes dehydration, creatine actually helps the body manage fluids more effectively at a cellular level. This can reduce the risk of:

- Muscle cramps
- Heat-related illness
- Strains and similar athletic injuries

## 6. Longevity and Bone Density

For those focused on health span, creatine is a vital tool against age-related muscle loss (sarcopenia). Research indicates that when combined with exercise, it may also help improve bone mineral density, providing a dual-layer of protection for the musculoskeletal system as we age.

### Let's Go!

You now have a greater understanding of how food interacts with your body. You have the tools to change your life for the rest of your life. Once you start this journey, I believe You will never want to go back to your old habits.

Nothing tastes as good as healthy feels.

With the Best-U plan, You are still eating satisfying, rich food—just the food that is Best for you. The hardest part of any journey is the thought of doing it. If you have read this far, you are already on your way.

### All you have to do now is:

Get prepared.

Set a start day.

Follow the plan.

### Start.

Believe me, you will not regret it. Your only regret will be not starting sooner.

I look forward to hearing about your success and the stories of people telling you how great you look.

When they do, please direct them to the plan that helped you.

All of the profit that this book receives is going straight back into advertising and marketing so as many people as possible can gain the benefits that I have been blessed with and know your money is going towards a good cause.

Your contribution could help another human find the happiness they deserve.

We are all part of Human Kind.

## CHAPTER SIX

# The Best-U Strength Protocol

Get Stronger, Live Longer

I have been weight training for over forty years. In that time, I have been a human guinea pig for every regime imaginable: Power lifting, CrossFit, Plyometrics, High-Rep endurance, and Yoga.

From this four-decade obsession, I created Best-U Strength. It is a combination of the most effective elements of these styles, stripped of the fluff and focused entirely on results. I have more than doubled the strength of every client who has used this plan—not in years, but in weeks.

## Results

The results above aren't from "gym rats" spending three hours a day lifting. They come from applying a specific technique called Time Under Tension (TUT) combined with a Yoga Internal Strength regime. I experimented on myself first, achieving massive gains in strength and stability, before rolling it out to my clients with 100% success.

## Muscle and Longevity

I discovered how important muscle is for longevity when I started training with my first boxing coach at 21. I was 115kg and mostly muscle. I thought I was strong. Manny was in his 70's and he destroyed me. He was 5 foot 6 and weighed around 80kg and would bench 100kg like it was nothing. He would do ten pull ups with 20kg hanging from his waist (Which I still cannot do). I saw him 20 years later and he was still in good shape. This made me realise how important muscle is for longevity.

Maintaining muscle mass and strength is a critical, independent predictor of longevity, as high muscle mass is strongly linked to lower all-cause mortality and reduced chronic disease risk. Muscle acts as a metabolic "sink" for blood sugar control, supports mobility, and prevents age-related decline (sarcopenia), which can increase mortality risk by 2-5 times.

- High muscular strength is inversely associated with mortality from cardiovascular diseases, cancer, and all-cause death.
- Muscles serve as the primary site for glucose uptake, protecting against insulin resistance, metabolic syndrome, and type 2 diabetes.
- Muscle mass declines by 1-3% annually after age 30, with up to 50% lost by age 70–80. Maintaining this mass is vital for metabolic and functional health.
- Strength training helps maintain mobility and prevents falls/fractures, which are major causes of death and morbidity in older adults.

**The "Organ of Longevity":** Muscle is now considered an endocrine organ that communicates with other systems to reduce inflammation and promote healthier aging.

## Time Under Tension: The 90-Degree Secret

Traditional "Time Under Tension" workouts usually involve performing a full range of motion at a agonizingly slow pace. My method is different.

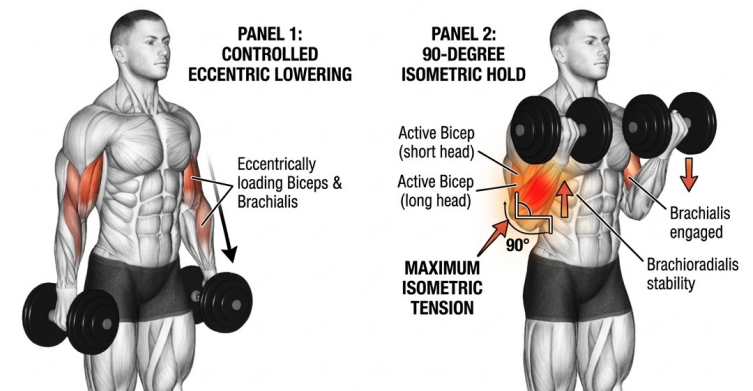

Through my research and testing, I discovered that your muscles hit their absolute peak recruitment—**Max Tension**—when the joint is at exactly **90 degrees**.

In the Best-U plan, we don't just pass through that 90-degree mark; we hold it. By freezing the movement at the point of maximum tension, we force every fibre in the muscle to switch on.

### Why the 90-Degree Hold Works:

- **Neural Drive:** It forces your brain to send a massive electrical signal to the muscle to keep it from failing.
- **Joint Safety:** It eliminates momentum and "bouncing," which is where 90% of gym injuries happen.
- **Hyper-Efficiency:** 10 reps with a 3 second hold at 90 degrees can be more effective for strength building than 15-20 sloppy, fast repetitions.

This principle applies to every single exercise in the plan. Whether it is a Shoulder Press, Chest Fly, Squat, or Tricep Extension, you will be finding that 90-degree "sweet spot" and owning it.

## The Best-U Strength Vocabulary

To get the most out of the following weeks, you need to understand the three pillars we will be rotating through:

- **Strength (The Foundation):** Heavy resistance, long holds. This builds the "hard" muscle and bone density.
- **Endurance (The Engine):** Lower weight, shorter rest, higher volume. This builds mitochondrial health and stamina.
- **Hypertrophy (The Growth):** Specific tension aimed at increasing muscle size and definition.

## The 90-Degree Angle Technique

This is the "how-to" of the Best-U movement. Forget everything you know about pumping out fast reps. We work in two distinct phases:

**The Warm-Up Set** and the **Heavy Set**.

### Set 1: The Warm-Up (10 Reps)

Choose a weight you feel you could do 10 reps with comfortably—not to failure, just enough to get the blood flowing.

1. **The Movement:** Using a bicep curl as an example, slowly bring the weights up from your side.
2. **The Hold:** Stop at exactly 90 degrees (halfway through the range of motion) and hold for 3 seconds.
3. **The Reset:** Slowly lower back to the starting position. That is one rep. Repeat for 10 reps.

**Pro Tip:** Record every weight you use. Use the Best-U spreadsheet or a notebook. If 10 reps were too easy, go heavier next time. If you couldn't reach 10, lower the weight.

### Set 2: The Heavy Set (4 to 6 Reps)

This is a totally different beast. You are going to pick a weight so heavy that you can only manage 3 to 4 reps while maintaining that 3-second hold at 90 degrees.

## How to Progress Organically

The goal is "Progressive Overload." By keeping the weight the same and increasing the reps, you prove your strength is growing:

- **Week 1:** You hit failure at 3-4 reps.
- **Week 2:** You hit 5 reps.
- **Week 3:** You hit 6 reps.
- **Week 4:** Since you reached 6 reps, you increase the weight for the next session. This should drop you back down to only being able to do 3-4 reps.

## What if you fail early?

- If you only manage **3 reps**, that's great! It means the weight is challenging. Aim for 4 next time.
- If you can only do **1 or 2 reps**, the weight is too heavy for your current level. Lower it immediately and finish the set with two more reps at the lower weight.

By repeating this process weekly, you are not just "exercising"—you are forced to increase your strength each week organically.

## Exercise Form Guide

Regardless of the movement, the logic remains the same:

1. **Start** from a prone or neutral position.
2. **Move** the weight to the 90-degree "Max Tension" point.
3. **Hold** for 3 seconds.
4. **Return** to start.

## Yoga Strength: The Synergy Effect

One of the most powerful phenomena you will experience with the Best-U Strength system is the **Total Body Activation**.

### The Bio-Feedback Loop

As you hold that 90-degree "sweet spot," you will feel your core tighten, your glutes engage, and your stabilizing muscles firing in unison. It is a feeling identical to holding a challenging Yoga position.

### Why Synergy Matters:

- **Internal Bracing:** Your body learns to create "internal tension." This protects your spine and joints better than any weight belt ever could.
- **Functional Growth:** Instead of isolating one muscle in a vacuum, you are teaching your body to work as a single, powerful unit.
- **The "Teardown" and Growth:** You can actually feel the fibres stretching and tearing under the load. This full-body recruitment is what allows you to double your strength—you aren't just using your "bicep" to lift the weight anymore; you are using your whole self.

This is where the "Strength" meets "Longevity." You are building a body that is as stable and controlled as a statue, yet as powerful as a machine.

## The Best-U Yoga Protocol

While we use weights to trigger this synergy, we also incorporate specific "holds" that require no equipment at all, focusing purely on internal resistance and balance. This ensures that even when the weights are gone, your body maintains that high-tension stability.

## 90 Minutes a Week to a New You: The Three-Day Split

I have designed this workout to hit every muscle in the body while creating massive strength results. Best of all, it can be done from the comfort of your own home with just dumbbells and minimal equipment—saving you travel time, parking fees, and the "gym-intimidation" that kills motivation.

To maximize growth while keeping your energy high, we use a **Three-Day Split**. I recommend training every two days (e.g., Monday, Wednesday, and Friday).

### The Split Logic:

**Day 1:** Chest / Biceps / Core

**Day 2:** Shoulders / Triceps / Core

**Day 3:** Legs / Back / Core

### Why This Works: Non-Opposing Muscle Groups

I pair muscles that don't compete for energy. When you finish a chest exercise and move to a bicep exercise, your chest muscles get to fully rest and recover.

We then insert a **Core exercise** after every two lifts. Your core is about 60% of your body—it is the engine. It is the only part of your body that gets smaller as it gets stronger, and a powerful core directly correlates to higher daily energy levels. By making **33% of the workout core-focused**, we give your primary muscles a rest to ensure maximum power on the next set while attacking your midsection from every angle.

## Cardio: The Fat-Burning Accelerator

If you want to maximize your results and drop fat even faster, add cardio on your "off" days (Tuesday, Thursday, and Saturday).

**The 8-Week Goal:** Aim for a one-hour walk on these days. Choose your favourite beach, a forest trail, or even a mall if the weather is bad.

**The Advanced Level (Stair Work):** Find a set of about 50 stairs. Jog to the top, walk slowly down. Repeat this for 15-30 minutes, aiming to increase your duration each week.

**Pro Tip:** The best time for cardio is just before a meal. Put it in your calendar the night before so you don't skip it.

## The Progress Spreadsheet: Your Psychological Edge

I've created a progress spreadsheet for the full 8-week plan, and it is a massive driver of the results my clients see. You can download the spreadsheet for free from the Best-U Facebook page.

### How to use it:

1. **Week 1:** Set your base level.
2. **The 4-to-6 Rule:** If you complete 6 reps at a certain weight with the 90-degree hold, you increase the weight next week. If you only hit 3 or 4 reps at that new weight, you stay there until you can do 6.
3. **The Power of "One More":** It is psychologically easier to aim for just one more rep than last time rather than a giant, audacious goal.
4. **The "Clean Sweep":** Every time you beat your previous result, you put that exercise in BOLD. When you improve on every single exercise in a workout, that is a "Clean Sweep." The motivation this creates is addictive—like crossing the finish line in first place.

## Injury Prevention through Tension

Because the Best-U plan focuses on holding rather than "smashing" heavy weights, the muscles are warmed up in the first set and safely stretched in the second. By focusing on the 3-second hold rather than explosive, sloppy movements, we dramatically decrease the risk of injury. My clients don't get injured because we are simply stretching the muscle one rep further, consistently, over time.

## Picking Your Weight: The "Golden Rule"

Before you start any exercise, you must select your resistance carefully. The goal is to be effective, not injured.

### The Warm-Up Set (Set 1)

For the first set of every exercise, you need to pick a weight that requires medium effort to complete 10 reps with 3-second holds.

- **Not Easy:** If you feel like you could do 20 reps, it's too light.
- **Not Hard:** If you are shaking or losing form by rep 5, it's too heavy.
- **Just Right:** It should feel like a solid warm-up that gets the blood flowing and the muscles awake.

### The Golden Rule of Safety

**Do not push too hard on any exercise.** This is the most important piece of advice I can give you. If you feel your form slipping, or if a weight feels dangerously heavy, stop and record exactly what you did.

Pushing too hard out of ego is what causes injuries. Trust the system: record your results, stay within your zone, and you will be stronger next time. We aren't trying to force the body; we are inviting it to grow by stretching the muscle one rep further, consistently, every single week.

## The Equipment

To get the full benefit of the Best-U workout, I recommend investing in a few essential pieces of equipment. I have designed this program to be performed entirely with a minimal setup—items that are inexpensive, space-efficient, and will likely last you a lifetime.

### 1. Adjustable Dumbbells

This is your most important investment. Adjustable dumbbells give you the equivalent of a full rack of weights while taking up only a fraction of the room.

**Beginner to Medium:** I recommend the **24kg set (48kg total)**. This is perfect for those starting out or with moderate lifting experience.

**Advanced:** If you are already quite strong and find a 48kg Bench Press too easy, I recommend the **40kg set (80kg total)**.

### 2. Pull-Up Bar

Vertical pulling is essential for upper body strength. Whether you use a sturdy beam, a tree branch in the yard, or purchase a dedicated doorway/wall-mounted pull-up bar, ensure you have something that can safely support your weight.

### 3. Adjustable Bench

While you can use items around the house to improvise, a dedicated gym bench is highly recommended for movements like the bench press. An **adjustable bench** is preferable so you can change angles to target different muscle groups.

### 4. Ab Roller

These are very inexpensive but highly effective. If you master the form on an Ab Roller, you will see abdominal definition and core strength faster than with almost any other tool.

## 5. Smart Scales

Lastly, I highly recommend a set of scales that measure **Weight, Fat %, BMI, and Water %**.

**Why this matters:** Many of my clients don't see the weight drop immediately because they are gaining muscle.

**The Data:** These scales allow you to monitor your progress exactly. As you stick to the nutrition and workout plans, you should see your **Weight, BMI, and Fat % go down**, while your **Water % goes up**. Most models connect to an app to map your progress automatically.

**You can't Procrastinate.** By having the right tools at home, you remove the excuse of "not having time to go to the gym" and turn your living space into a centre for longevity.

## The Best-U Movement Manual

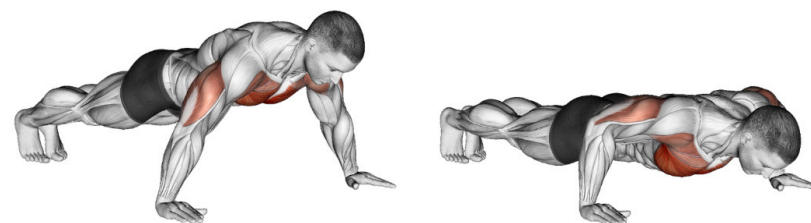

The Best-U Strength system is an engineered approach to muscle growth and joint longevity. We focus on the 90-Degree Technique: your muscles hit peak recruitment when the joint is at exactly 90 degrees. By holding the weight at this "point of maximum tension," you force the body into a state of Yoga Synergy, where your core and stabilizing muscles must fire in unison to support the load.

## EXAMPLES OF EVERY EXERCISE

### The Chest Movements

#### Press Ups (Standard)

Start in a full extended position. Slowly go down until your arms are at a 90-degree angle. Hold this position for 3 seconds. Then push up to full extended position. This is one rep. Repeat for 10 reps. If you can't complete 10, finish on your knees. Eventually, you will do them all full-body.

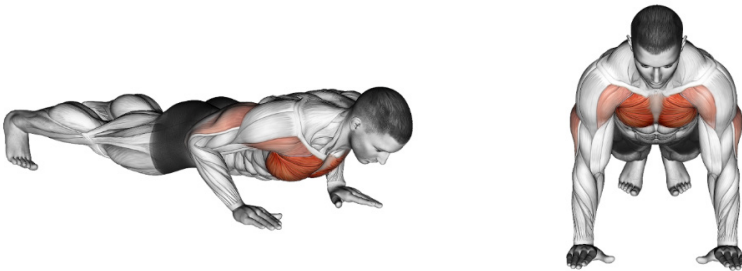

#### Wide Press Ups

Go down to a press-up position, then widen your arms as far as you can. You will have less range of motion, which is fine—the benefit is the tension. Slowly lower yourself until you are halfway down and your elbow is at 90 degrees. Hold for 3 seconds, then raise back up. 10 Reps. (Modify on knees if needed).

### Clock Push Up (Close Grip)

Go down to a press-up position with hands shoulder-width apart, turned out slightly. As you go down, your elbows should stay close to your ribs. Lower halfway and hold for 3 seconds. Return to full extension. 10 Reps.

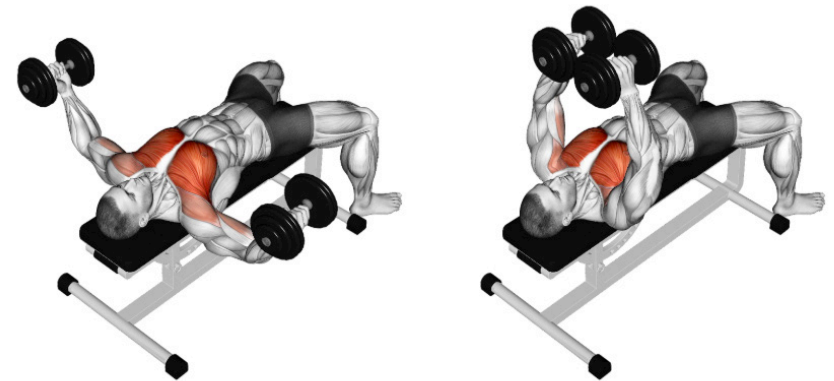

### Flat Bench Press

Pick a weight you can do for 10 reps (Gents ~14kg, Ladies ~6kg). Lie back and lower the weights until your elbows are at 90 degrees. Hold for 3 seconds. Extend to the top. Repeat for 10 reps. (Can be used as an alternative to Standard Press Ups).

### Dumbbell Flys

Pick a weight (Gents ~14kg, Ladies 4–6kg). Lie back with weights straight up in front of your face. Slightly bend your elbows, then slowly lower your arms to the sides. Hold at the bottom for 3 seconds, then bring them back to the upright position. Aim for 10 Reps. (Alternative to Wide Press Ups).

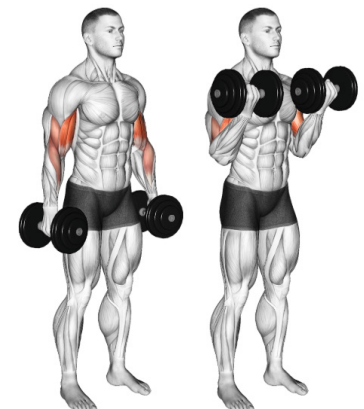

## 2. The Bicep & Arm Movements

### Bicep Curls

**Warm-up:** Start with weights at your side. Slowly raise to halfway (90-degree arm angle). Hold for 3 seconds. Lower back down. 10 Reps.

**Heavy Set:** Pick a weight you can only do for 3–4 reps. It doesn't matter how you get it to 90 degrees (a slight swing is okay). Gents hold 3 seconds / Ladies hold 10 seconds. Lower slowly.

### Hammer Curls

Start at a prone position at your side. Slowly bring the weight up to 90 degrees (palms facing in). Hold for 3 seconds. Release back down. 10 Reps for warm-up. Apply heavy set logic for Set 2.

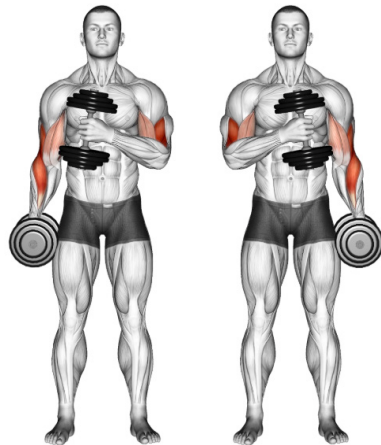

**Heavy Set:** Pick a weight you can only do for 3–4 reps. It doesn't matter how you get it to 90 degrees (a slight swing is okay). Gents hold 3 seconds / Ladies hold 10 seconds. Lower slowly.

### Cross Body Hammer Curl

Start with dumbbells at your side. Slowly bring one dumbbell up across your chest until it is in front of your face. Hold for 3 seconds. Release and repeat for the other arm. Both arms = one rep. 10 Reps.

**Heavy Set:** Pick a weight you can only do for 3–4 reps. It doesn't matter how you get it to 90 degrees (a slight swing is okay). Gents hold 3 seconds / Ladies hold 10 seconds. Lower slowly.

## 3. The Shoulders & Tricep Movements

### Shoulder Press

Pick a weight you can do for ten reps without too much effort (Gents ~10kg, Ladies ~4kg). Start with the weights prone at your side. Raise your arms up above your head. Slowly lower until they are at 90 degrees (the "goalpost" position). Hold for 3 seconds. Then raise back up till above your head. Aim for 10 Reps.

**Heavy Set:** Pick a weight you can only do for 3–4 reps. It doesn't matter how you get it to 90 degrees (a slight swing is okay). Gents hold 3 seconds / Ladies hold 10 seconds. Lower slowly..

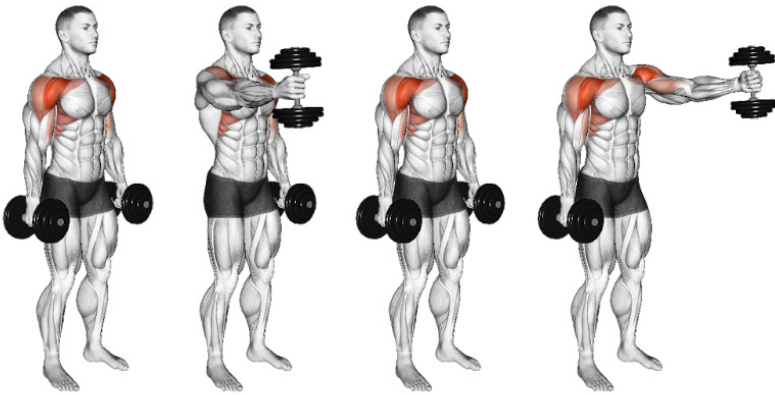

### Front Raises

**Warm-Up Set:** Pick a weight you can do for ten reps without too much effort (Gents ~8kg, Ladies ~2-3kg). Start with the weights prone at your side. Raise one arm up until the weight is directly in front of your face. Hold for 3 seconds. Lower back to your side. Repeat with the other arm. Aim for 10 Reps.

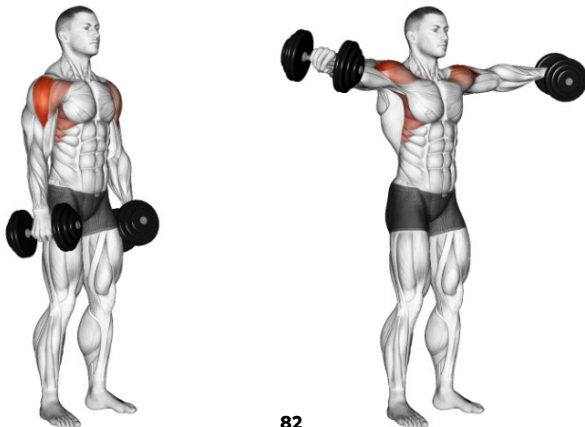

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

### Lateral Raises

Pick a weight you can do for ten reps without too much effort (Gents ~6kg, Ladies ~3kg). Start with weights prone at your side. Raise your arms out to the sides until the weight is 90 degrees horizontal. Hold for 3 seconds. Aim for 10 reps.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

### Flat Bench Lateral Raise

Pick a weight you can do for ten reps without too much effort (Gents ~6kg, Ladies ~2kg). Lie face down on the bench with the weights on the floor to your side. Pick up the weights and raise them horizontally out and up. Hold for 3 seconds. Aim for 10 Reps.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

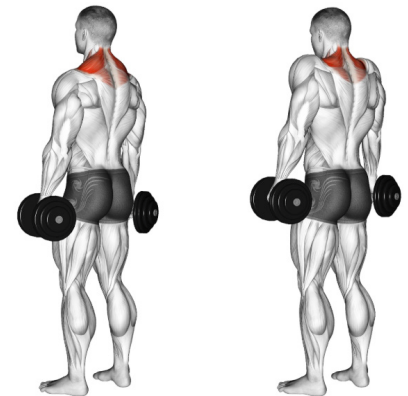

### Shrugs

Pick a weight for ten reps (Gents ~14kg, Ladies ~6kg). Start with weights prone at your side.

**The Sequence:** Raise shoulders up. Hold for 3 seconds. Lower back down.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

### Tricep Extension (Standing or Seated)

Grab the warm-up weight (Gents ~10kg, Ladies ~4kg). Bring the weight to be held by both hands above your head at full extension. Lower the weight behind your head until your elbows are at 90 degrees. Hold this position for 3 seconds. Aim for 10 Reps.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

## 5. The Back Movements

### One-Arm Row

Pick a weight you can do for ten reps without too much effort (Gents ~16kg, Ladies ~6-8kg). Lean over a bench or couch. Start with the weight prone on the ground. Raise your arm up until it is at 90 degrees (your elbow should be level with your torso) Hold this position for 3 seconds.. Aim for 10 Reps per arm.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

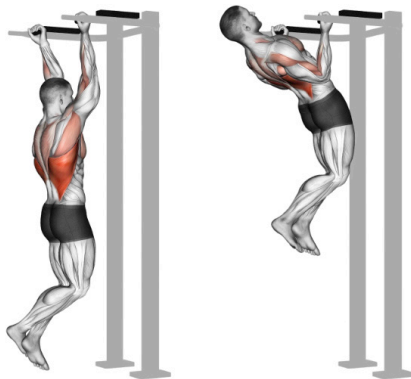

### Pull-Ups (Knuckles Towards U)

Use any type of pull-up bar (or even a sturdy tree branch). Start standing on the ground. Jump up and grab the bar approximately shoulder-width apart with your knuckles facing toward you. Lower yourself until your elbows are at 90 degrees. Hold for 3 seconds. Aim for 10 Reps (or as many as you can). Record your number and beat it next time.

### Pull-Ups (Knuckles Away From U)

Start standing on the ground. Jump up and grab the bar approximately shoulder-width apart, this time with your knuckles facing away from you. Lower yourself until your elbows are at 90 degrees. Hold for 3 seconds. Aim for 10 Reps (or as many as you can).

## 6. The Leg Movements

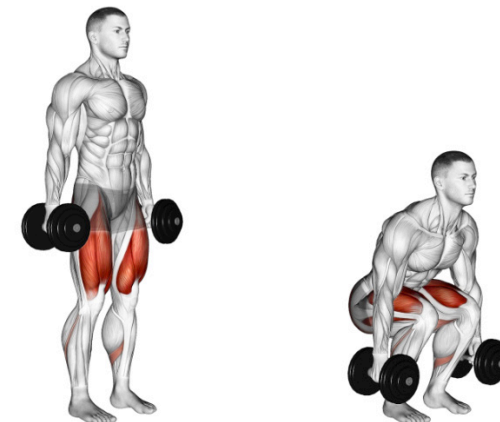

### Squats (Bodyweight)

Start in the standing position with your arms in front of you. Lower your body until your knees are at a 90-degree angle. Keep your head up and hold this position for 3 seconds. Aim for 10 Reps

### Dumbbell Squats (Heavy Set)

Pick a weight you can only do for 4 to 6 reps (Gents ~16kg, Ladies ~8-10kg). Start with the weights prone at your side in a standing position. Lower your body until your knees are at 90 degrees. Keep your head up. Gents hold for 3 seconds / Ladies hold for 10 seconds. Aim for 6-8 Reps.

### Lunges (Bodyweight)

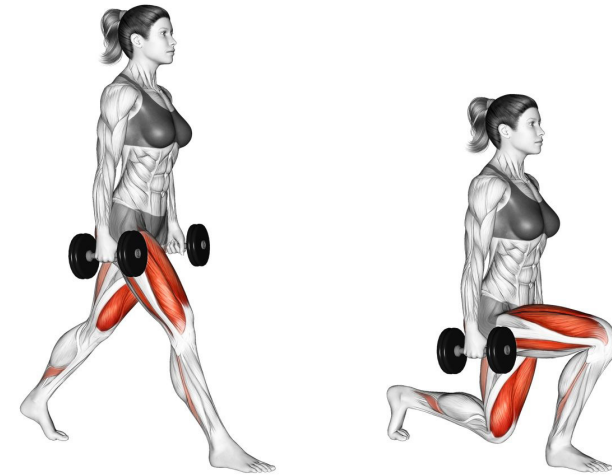

Start in the standing position. Keeping your head up, take a long step forward. Slowly lower yourself until your front knee is at 90 degrees. Hold there for 3 seconds. Aim for 10 Reps.

### Weighted Lunges

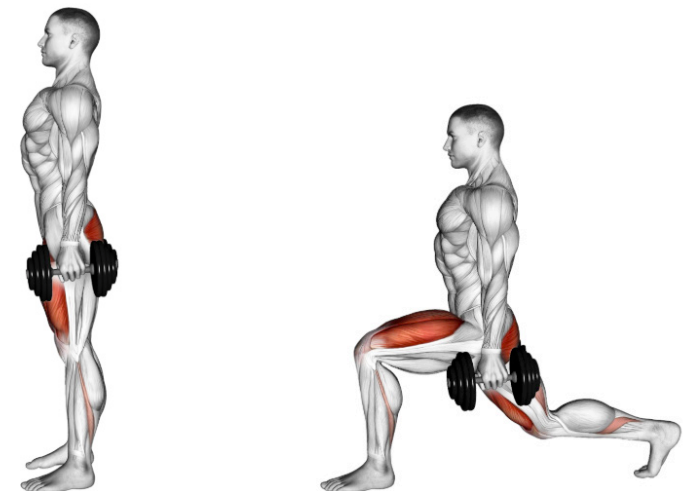

Pick a weight you can do for 4 to 6 reps (Gents ~16kg, Ladies ~6-8kg). Start in the standing position. Take a long step forward while keeping your head up. Lower yourself until your knee is at 90 degrees. Hold there for 3 seconds. Aim for 4 to 6 Reps.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Rep.s

### Reverse Lunges

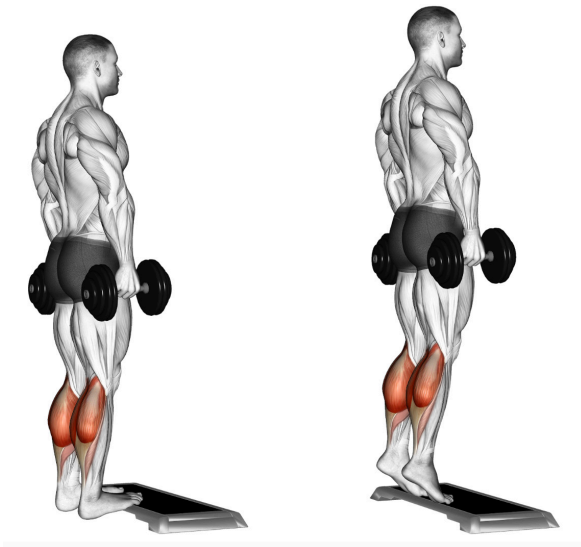

Start in the standing position. Keeping your head up, take a long step backward. Slowly lower yourself until your knee is at 90 degrees. Hold there for 3 seconds. Aim for 10 Reps.

### Standing Calf Raises

Hold a weight (roughly 16kg for men or 6-8kg for women) at your sides while standing with your toes on a small ledge or weight plates. Slowly raise your heels as high as possible, hold the peak contraction for three seconds, and then lower back down with control. Hold there for 3 seconds. Aim for 10 Reps.

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

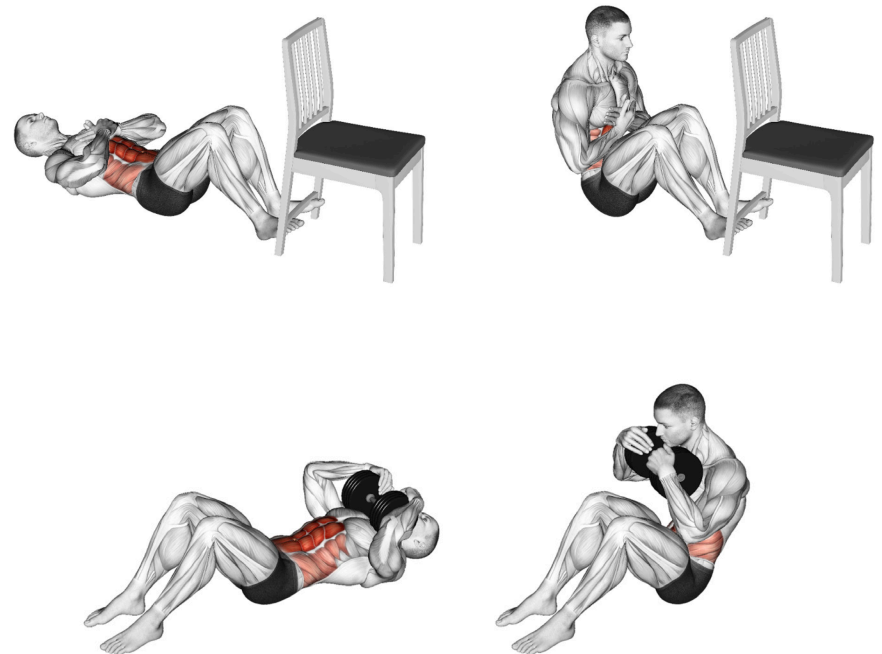

**Heavy Set:** Pick a weight you can do for 3 to 4 reps (Gents ~10kg, Ladies ~4-5kg). Raise the weight to face level. Gents hold for 3 seconds / Ladies hold for 10 seconds. Lower slowly. 4 to 6 Reps.

## 6. The Core Movements

### Sit Ups

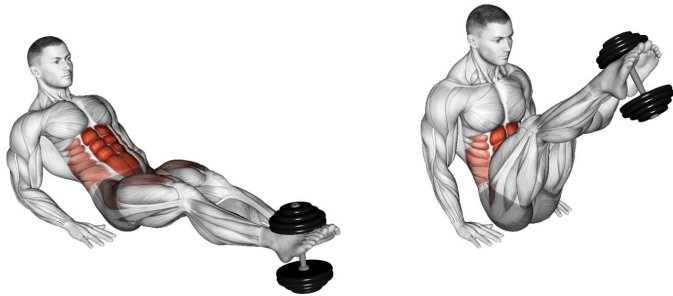

Hook your feet under a set of weights or a chair. Place your arms across your chest. Start with your chest touching your knees. Slowly lower yourself back until you are halfway to the floor (hips at 90 degrees). Aim for 10 reps

**The Graduation:** If you can complete 6 reps with a 10-second hold, you graduate to the Weighted Sit Up. Hold a 5–10kg dumbbell to your chest, lower halfway, and hold for 3 seconds before returning to the top.

### Leg Raises or Weighted Leg Raise

Lie flat on your back. Put your hands under your buttocks for support. Slowly raise your legs until they are pointing vertically. Lower them slowly until you are halfway down (about 45 degrees). Hold halfway down for 3 seconds. Aim for 10 Reps

**The Graduation:** If you can easily do 6 reps with a 10-second hold, graduate to Weighted Leg Raises. Hold a 5–10kg dumbbell between your feet. Lower to the point of maximum tension (just under 45 degrees), hold for 3 seconds, and return.

### Plank

Go down to a push-up position, then transition your weight onto your elbows and forearms. Keep your body in a straight line from head to heels.

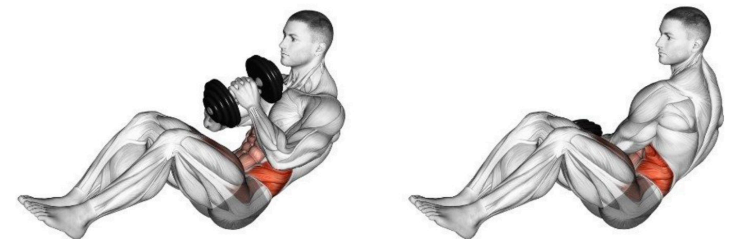

**The Goal:** Start a timer and hold this position for as long as you possibly can.

**Tracking:** Record this time in your spreadsheet. Your only goal is to beat your previous time the next time you perform the exercise.

### Russian Twist

Start on the ground with your feet hooked under a couch or similar heavy object. Lean back halfway and hold that position. Place your hands on your chest. Aim for 10 Reps (Left + Right = 1 rep).

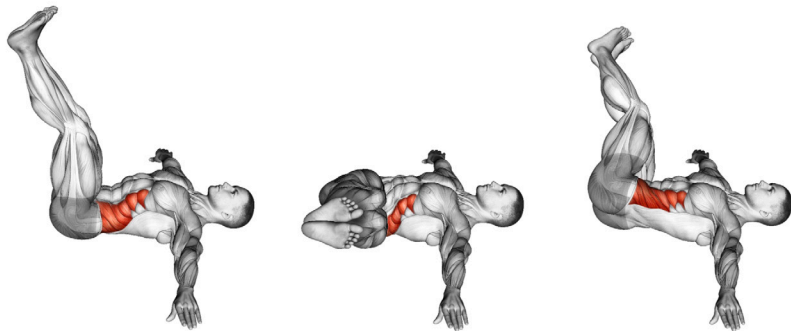

**The Twist:** Twist your body fully to the left, then fully back to the right.

**The Graduation:** If you can complete 20 reps easily, graduate to the Weighted Russian Twist. Hold a 5–10kg dumbbell to your chest while performing the twists. If this becomes too easy, increase the weight until you can only manage 10 reps.

### Wipers

Lie on your back and place your hands under something sturdy that will hold your weight to the ground. Raise your legs until they are at 90 degrees (vertical to the ceiling). Slowly lower your legs to the right side, keeping them straight, until they nearly touch the floor. Using your core strength, slowly bring your legs all the way back up and over to the left side until they again nearly touch the floor. Aim for 20 Reps (Left + Right = 1 rep).

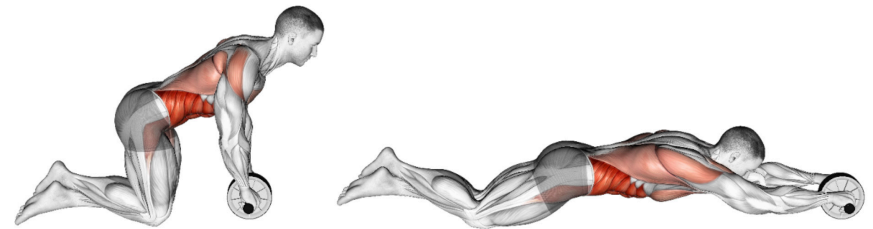

**Pro Tip:** This move is about control, not speed. The slower you go, the more you force those side-abdominal muscles to "wipe" the weight across your midline

### Ab Roller

Kneel on a soft surface and grip the roller handles with your arms extended directly beneath your shoulders. Focus on a "hollow body" position by tucking your pelvis and slightly rounding your upper back to protect your spine. Slowly roll the wheel forward, moving your hips and torso as a single unit, and descend only as far as you can without letting your lower back arch or sag. Aim for as many reps as you can.

**Tracking:** Record your reps in your spreadsheet. Your only goal is to beat your previous reps the next time you perform the exercise.

## CHAPTER SIX

# The 8-Week Strength Program

Lets' build a body that will make you strong and resilient.

Consistency over time equals results

To be clear with the bodyweight exercises the higher numbers below are a goal. i.e. 10 x 3 second press ups. Do as many as you can. i.e the first time you may only do 4 reps. Record the result. Next time you come back to the exercise you will be stronger. You should do 5 or more easily. This is the same with all the exercises. It also works the same way if you go heavier than the goal. These are goal guidelines. The spreadsheet is what you work with. Fill in your details. Be accurate. Follow the form and you will get stronger in the correct way. In regards to the exercises using weights you use the weight adjustment to make the 10 reps. I.e. Bicep Curl 10 Reps x 6-10kg x 3 sec. So if you can only do 4 reps with 10kg, lower the weight to 6kg.

**The 8-Week Strength Program - continued****DAY 1 – WEEK 1**

| Chest / Bicep          | Set 1                    | Set 2                      |
|------------------------|--------------------------|----------------------------|
| Press Up               | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Bicep Curl             | 10 Reps x 6-10kg x 3 sec | 3-6 Reps x 12-18kg x 3 sec |
| Sit Ups                | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Wide Press Ups         | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Hammer Curls           | 10 Reps x 6-10kg x 3 sec | 3-6 Reps x 12-18kg x 3 sec |
| Leg Raises             | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Clock Push Up          | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Cross Body Hammer Curl | 10 Reps x 6-10kg x 3 sec | 3-6 Reps x 12-18kg x 3 sec |
| Plank                  | 10-60 sec                | 10-60 sec                  |

**DAY 2 – WEEK 1**

| Shoulders / Tris | Set 1                    | Set 2                      |
|------------------|--------------------------|----------------------------|
| Shoulder Press   | 10 Reps x 6-10kg x 3 sec | 3-6 Reps x 12-18kg x 3 sec |
| Bench Dips       | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Sit Ups          | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Front Raises     | 10 Reps x 4-8kg x 3 sec  | 3-6 Reps x 8-12kg x 3 sec  |
| Tricep Extension | 10 Reps x 6-10kg x 3 sec | 3-6 Reps x 12-18kg x 3 sec |
| Leg Raises       | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Lateral Raises   | 10 Reps x 4-8kg x 3 sec  | 3-6 Reps x 8-12kg x 3 sec  |
| Clock Push Ups   | 1-10 Reps x 3 sec        | 1-6 Reps x 10 sec          |
| Plank            | 10-60 sec                | 10-60 sec                  |

**The 8-Week Strength Program - continued****DAY 3 – WEEK 1**

# Thank you

Firstly I would like to thank you for taking the time to read this book. It is my life's work and is not only an accumulation of the knowledge I have learnt from many great teachers, but from the struggles of dealing with all the issues I have covered.

I have been in the trenches and fought all of the battles needed to not only beat these temptations, but to learn from them and teach a way to pass on to others.

The words are a gift from God, I am just the messenger.

I was given the strength to deal with them from the big man upstairs and if you follow this way, trust me, your life will be so much better you will thank him also.

I wrote this book to spread the word and help as many people as I can, not for personal gain.

So ALL of the profit that this book receives is going straight back into marketing and advertising so as many people as possible can gain the benefits that I have been blessed with and potentially help fight metabolic disease.

If this works for you. Please share the knowledge with everyone you know that may need it and know your money is going towards a good cause.

Your contribution could help another human find the happiness they deserve.

We are all part of HumanKind.

Much love

Aaron

Author Aaron Caville comprises over thirty years of high level sport and Nutrition and takes the Best parts of all the diet and training regimes he has researched to create a plan Best for U.

It is an easy to follow plan that focuses on the number one reason all diets fail. Hunger.

It is designed for the busy, on-the-run person that fits easily into any lifestyle.

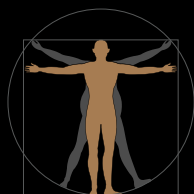

It not only reduces hunger / fat / weight but increases energy, mental acuity, strength, hydration levels, vitamin and sleep requirements.

All with natural foods.

It works for all types of diets, whether you are a carnivore, vegetarian, or vegan.

It is a lifestyle, not a diet.

All of his clients live by this new regime as it is sustainable for life.

**Best-U**
